UNITED NATIONS

Reports published by the International Narcotics Control Board in 2013

The *Report of the International Narcotics Control Board for 2013* (E/INCB/2013/1) is supplemented by the following reports:

Narcotic Drugs: Estimated World Requirements for 2014; Statistics for 2012 (E/INCB/2013/2)

Psychotropic Substances: Statistics for 2012; Assessments of Annual Medical and Scientific Requirements for Substances in Schedules II, III and IV of the Convention on Psychotropic Substances of 1971 (E/INCB/2013/3)

Precursors and Chemicals Frequently Used in the Illicit Manufacture of Narcotic Drugs and Psychotropic Substances: Report of the International Narcotics Control Board for 2013 on the Implementation of Article 12 of the United Nations Convention against Illicit Traffic in Narcotic Drugs and Psychotropic Substances of 1988 (E/INCB/2013/4)

The updated lists of substances under international control, comprising narcotic drugs, psychotropic substances and substances frequently used in the illicit manufacture of narcotic drugs and psychotropic substances, are contained in the latest editions of the annexes to the statistical forms ("Yellow List", "Green List" and "Red List"), which are also issued by the Board.

Rapports publiés par l'Organe international de contrôle des stupéfiants en 2013

Le *Rapport de l'Organe international de contrôle des stupéfiants pour 2013* (E/INCB/2013/1) est complété par les rapports suivants:

Stupéfiants: Évaluations des besoins du monde pour 2014 – Statistiques pour 2012 (E/INCB/2013/2)

Substances psychotropes: Statistiques pour 2012 – Prévisions des besoins annuels médicaux et scientifiques concernant les substances des Tableaux II, III et IV de la Convention de 1971 sur les substances psychotropes (E/INCB/2013/3)

Précurseurs et produits chimiques fréquemment utilisés dans la fabrication illicite de stupéfiants et de substances psychotropes: Rapport de l'Organe international de contrôle des stupéfiants pour 2013 sur l'application de l'article 12 de la Convention des Nations Unies contre le trafic illicite de stupéfiants et de substances psychotropes de 1988 (E/INCB/2013/4)

Les listes à jour des substances sous contrôle international, comprenant les stupéfiants, les substances psychotropes et les substances fréquemment utilisées dans la fabrication illicite de stupéfiants et de substances psychotropes, figurent dans les dernières éditions des annexes aux rapports statistiques annuels ("Liste jaune", "Liste verte" et "Liste rouge") publiées également par l'Organe.

Informes publicados por la Junta Internacional de Fiscalización de Estupefacientes en 2013

El *Informe de la Junta Internacional de Fiscalización de Estupefacientes correspondiente a 2013* (E/INCB/2013/1) está complementado por los siguientes informes:

Estupefacientes: Previsiones de las necesidades mundiales para 2014; Estadísticas de 2012 (E/INCB/2013/2)

Sustancias Sicotrópicas: Estadísticas de 2012; Previsiones de las necesidades anuales para fines médicos y científicos de las sustancias de las Listas II, III y IV del Convenio sobre Sustancias Sicotrópicas de 1971 (E/INCB/2013/3)

Precursores y productos químicos frecuentemente utilizados para la fabricación ilícita de estupefacientes y sustancias sicotrópicas: Informe de la Junta Internacional de Fiscalización de Estupefacientes correspondiente a 2013 sobre la aplicación del artículo 12 de la Convención de las Naciones Unidas contra el Tráfico Ilícito de Estupefacientes y Sustancias Sicotrópicas de 1988 (E/INCB/2013/4)

Las listas actualizadas de las sustancias sometidas a fiscalización internacional, que comprenden estupefacientes, sustancias sicotrópicas y sustancias frecuentemente utilizadas para la fabricación ilícita de estupefacientes y sustancias sicotrópicas, figuran en las ediciones más recientes de los anexos de los formularios estadísticos ("Lista Amarilla", "Lista Verde" y "Lista Roja"), también publicados por la Junta.

Introduction

1. In addition to its annual report, the International Narcotics Control Board (INCB) publishes technical information in accordance with the following provisions of the Convention on Psychotropic Substances of 1971:

"Article 18. Reports of the Board

"1. The Board shall prepare annual reports on its work containing an analysis of the statistical information at its disposal, and, in appropriate cases, an account of the explanations, if any, given by or required of Governments, together with any observations and recommendations which the Board desires to make. The Board may make such additional reports as it considers necessary. The reports shall be submitted to the Council through the Commission, which may make such comments as it sees fit.

"2. The reports of the Board shall be communicated to the Parties and subsequently published by the Secretary-General. The Parties shall permit their unrestricted distribution."

2. The technical data are published for control purposes and to meet the needs of researchers, enterprises and the general public. Pursuant to the provisions of article 16, paragraph 4, parties are required to furnish to the Board annual statistical reports relating to the substances listed in Schedules I-IV of the 1971 Convention. The statistical data that parties to the 1971 Convention are required to furnish to the Board differ according to the Schedule in which a given substance is included. The individual tables of the present technical report are based on those data.

3. Data reported later than 1 November 2013 could not be taken into consideration in preparing this technical report.

4. Based on information received during a survey of needs of users of its technical report on psychotropic substances carried out in 2004 and 2005, the Board decided to make some modifications to the report beginning in 2005. Introductory notes were added before each statistical table to provide more detailed explanations on the information contained in the publication. Table IV, which presents the comparative analysis of the levels of calculated consumption for psychotropic substances, was expanded to include relevant information on two substances, namely buprenorphine and methylphenidate.

5. In 2012, the Board decided to modify the structure of its technical publication on psychotropic substances by moving some information to the annexes. The Board also decided to reduce the overall volume of the printed part of the publication by including the annexes in a CD-ROM* attached to the printed part of the publication. All information contained in the previous editions of the publication continues to be included in the publication, although in a different order (see page *iii*). Readers who wish to access the information contained in the annexes will have to make use of the attached CD-ROM. The entire publication, including the annexes, will also be available on the INCB website (www.incb.org).

*The CD-ROM contains the entire publication, including the annexes, and other selected INCB publications.

Table II. Receipt of statistics for 2012

Table II reflects the extent of compliance by Governments with the provisions of article 16 of the 1971 Convention in submitting to INCB annual statistical information for 2012. The table also shows to what extent Governments have voluntarily submitted additional information to INCB, pursuant to recommendations of the Board endorsed by the Economic and Social Council and by the Commission on Narcotic Drugs, that is, quarterly statistics on international trade in substances in Schedule II, and information on countries of destination of exports and countries of origin of imports of substances in Schedules III and IV (Council resolutions 1981/7, 1985/15 and 1987/30) and statistics on the consumption of psychotropic substances (CND resolution 54/6). The following symbols are used in table II:

A question mark (?) indicates that the statistical report for 2012 had not been received by 1 November 2013;

The letter "x" indicates that the substances listed in the relevant Schedule are under national control and that the competent administration has furnished for 2012 at least part of the required statistical information;

A dash (—) indicates that the substances listed in the relevant Schedule are under national control but no movement of the substances has been reported by the competent administration;

The letter "o" indicates that substances in Schedule II are neither imported into nor exported from the country or territory and therefore the Government was not requested by INCB to provide quarterly trade statistics;

Two dots (..) indicate that the competent administration was not able to furnish data on the substances in the relevant Schedule for 2012, mostly due to a lack of legislative and/or administrative measures enabling the data to be collected. If, however, a competent administration has supplied information on some of the substances listed in the respective Schedule, such cases are mentioned in a footnote.

Countries and non-metropolitan territories are listed in English alphabetical order; the names of territories are shown in italics. The names of countries and territories are those that were in official use at the time the data were collected (in 2012).

Tableau II. Réception des statistiques pour 2012

Le tableau II indique quels gouvernements se sont conformés aux dispositions de l'article 16 de la Convention de 1971 en soumettant à l'OICS des statistiques annuelles pour 2012. Ce tableau indique aussi dans quelle mesure les gouvernements ont volontairement soumis à l'OICS des informations supplémentaires, conformément aux recommandations de l'OICS approuvées par le Conseil économique et social et par la Commission des stupéfiants, c'est-à-dire des statistiques trimestrielles sur le commerce international des substances du Tableau II, des renseignements sur les pays de destination des exportations et les pays d'origine des importations de substances inscrites aux Tableaux III et IV (résolutions 1981/7, 1985/15 et 1987/30 du Conseil) et des statistiques sur la consommation de substances psychotropes (résolution 54/6 de la Commission). Dans ce tableau, les symboles suivants ont été utilisés:

Un point d'interrogation (?) indique que le rapport statistique pour 2012 n'avait pas été reçu au 1^{er} novembre 2013;

La lettre "x" indique que les substances inscrites au Tableau en question sont sous contrôle national et que l'administration compétente a fourni au moins une partie des données statistiques requises pour 2012;

Un tiret (—) indique que les substances inscrites au Tableau en question sont sous contrôle national, mais que l'administration compétente n'a signalé aucun mouvement des substances en question;

La lettre "o" indique que les substances du Tableau II ne sont ni importées dans le pays ou le territoire, ni exportées de ce pays ou de ce territoire et que, par conséquent, l'OICS n'a pas demandé au gouvernement de statistiques trimestrielles sur le commerce de ces substances;

Deux points (..) indiquent que l'administration compétente n'a pas été en mesure de fournir pour 2012 les statistiques relatives aux substances inscrites au Tableau en question du fait, le plus souvent, de l'insuffisance des mesures législatives ou administratives permettant de recueillir les informations requises. Au cas où les administrations compétentes ont fourni des informations sur certaines des substances inscrites à ce Tableau, mention en est faite dans une note.

Les pays et territoires figurent dans l'ordre alphabétique anglais; les noms des territoires apparaissent en italique. Les noms des pays et territoires sont ceux qui étaient officiellement en usage au moment où les données ont été recueillies (en 2012).

Cuadro II. Recepción de las estadísticas de 2012

En el cuadro II se refleja la medida en que los gobiernos cumplen con las disposiciones del artículo 16 del Convenio de 1971 en lo que respecta a la presentación a la JIFE de la información estadística anual correspondiente a 2012. En el cuadro también se indica en qué medida los gobiernos han presentado voluntariamente a la JIFE, en cumplimiento de las recomendaciones de la Junta, que hicieron suyas el Consejo Económico y Social y la Comisión de Estupefacientes, información adicional, como, por ejemplo, estadísticas trimestrales sobre comercio internacional de sustancias incluidas en la Lista II, información sobre los países de destino de las exportaciones y los países de origen de las importaciones de sustancias incluidas en las Listas III y IV (resoluciones 1981/7, 1985/15 y 1987/30 del Consejo Económico y Social) y estadísticas sobre el consumo de sustancias sicotrópicas (resolución 54/6 de la Comisión). En dicho cuadro se utilizan los símbolos siguientes:

El signo de interrogación (?) indica que al 1 de noviembre de 2013 no se había recibido el informe estadístico correspondiente a 2012;

La letra "x" indica que las sustancias incluidas en la Lista correspondiente están sometidas a fiscalización nacional y que la administración competente ha facilitado por lo menos una parte de la información estadística requerida correspondiente a 2012;

El guión largo (—) indica que las sustancias incluidas en la Lista correspondiente están sometidas a fiscalización, pero que la administración competente no registró ningún movimiento;

La letra "o" indica que las sustancias incluidas en la Lista II no se importan ni se exportan de este país o región y que, por consiguiente, la JIFE no pidió al gobierno que suministrara estadísticas de comercio trimestrales;

Los dos puntos suspensivos (..) indican que la administración del país de que se trate no pudo facilitar datos correspondientes a 2012 acerca de las sustancias incluidas en la Lista pertinente debido a que todavía no se han adoptado medidas legislativas y administrativas que permitan reunir los datos. No obstante, si las administraciones competentes han suministrado información sobre algunas sustancias incluidas en la Lista respectiva, esos casos se mencionan en notas de pie de página;

Los países y territorios no metropolitanos se enumeran en orden alfabético inglés; los nombres de los territorios aparecen en letra cursiva. Los nombres de los países y territorios son los que se utilizaban oficialmente en el momento en que se obtuvo la información (en 2012).

Table III. Defined daily doses for statistical purposes (S-DDD) for psychotropic substances

The term “defined daily doses for statistical purposes (S-DDD)”, which has replaced the term “defined daily doses (DDD)”, is used by INCB as a technical unit of measurement for the purpose of statistical analysis and is not a recommended prescription dose. Its definition is not free of a certain degree of arbitrariness. Certain psychotropic substances may be used in certain countries for different treatments or in accordance with different medical practices, and therefore a different daily dose could be more appropriate. The

indicated defined daily doses for statistical purposes should be considered approximate and subject to modifications if more precise information becomes available. The basis for the grouping of the substances was, as far as possible, the anatomical therapeutic chemical (ATC) classification system used in the Nordic Statistics on Medicines and recommended by the World Health Organization (WHO) for drug utilization studies. In addition, the grouping reflects the Schedules of the 1971 Convention.

**Table III.1. Defined daily doses for statistical purposes (S-DDD)
for psychotropic substances, by schedule**

para las sustancias sicotrópicas, por lista**

	S-DDD (mg)		S-DDD (mg)
Substances listed in Schedule II		Amfepramone — Amfépramone — Anfepramona	75.00
Substances inscrites au Tableau II		Aminorex	—
Sustancias incluidas en la Lista II		Barbital	500.00
Amfetamine — Amfétamine — Anfetamina	15.00	Benzfétamine — Benzfétamine — Benzfetamina	75.00
Amineptine — Amineptina	—	Bromazepam — Bromazépam	10.00
4-Bromo-2,5-dimethoxyphenethylamine (2C-B) —		Brotizolam	0.25
4-Bromo-2,5-diméthoxyphénéthylamine —		Butobarbital	150.00
4-Bromo-2,5-dimetoxifenetilamina	—	Camazepam — Camazépam	30.00
<i>delta</i> -9-Tetrahydrocannabinol and its stereochemical		Chlordiazepoxide — Chlordiazépoxide — Clordiazepóxido . .	30.00
variants —		Clobazam	20.00
<i>delta</i> -9-Tétrahydrocannabinol et ses variantes		Clonazepam — Clonazépam	8.00
stéréochimiques —		Clorazepate — Clorazépate — Clorazepato	20.00
<i>delta</i> -9-Tétrahydrocannabinol y sus variantes		Clotiazepam — Clotiazépam	15.00
estereoquímicas	30.00	Cloxazolam	9.00
Dexamfetamine — Dexanfétamine — Dexanfetamina	15.00	Delorazepam — Délorazépam	3.00
Fenetylline — Fénétylline — Fenetilina	50.00	Diazepam — Diazépam	10.00
<i>gamma</i> -Hydroxybutyric acid (GHB) ^a —		Estazolam	3.00
Acide <i>gamma</i> -hydroxibutyrique (GHB) ^a —		Ethchlorvynol — Etclorvinol	500.00
Ácido <i>gamma</i> -hidroxibutírico (GHB) ^a	—	Ethinamate — Éthinamate — Etinamato	500.00
Levamisfetamine — Lévamfétamine — Levanfetamina	15.00	Ethyl loflazepate — Loflazépate d'éthyle —	
Levomethamphetamine — Lévométhamphétamine —		Loflazepato de etilo	2.00
Levometanfetamina	15.00	Etilamfetamine — Étilamfétamine — Etilanfetamina	30.00
Mecloqualone — Mécloqualone — Meclocualona	200.00	Fencamfamin — Fencamfamine — Fencanfamina	80.00
Metamfetamine — Métamfétamine — Metanfetamina	15.00	Fenproporex	20.00
Metamfetamine racemate —		Fludiazepam — Fludiazépam	0.75
Racémate de métamfétamine —		Flurazepam — Flurazépam	30.00
Racemato de metanfetamina	15.00	Halazepam — Halazépam	100.00
Methaqualone — Méthaqualone — Metacualona	200.00	Haloxazolam	7.50
Methylphenidate — Méthylphénidate — Metilfenidato	30.00	Ketazolam — Kétazolam	30.00
Phencyclidine — Fenciclidina	—	Lefetamine (SPA) — Léfétamine (SPA) — Lefetamina (SPA) . .	75.00
Phenmetrazine — Phenmétrazine — Fenmetracina	50.00	Loprazolam	1.00
Secobarbital — Sécobarbital	100.00	Lorazepam — Lorazépam	2.50
Zipeprol — Zipéprol	200.00	Lormetazepam — Lormétazépam	1.00
		Mazindol	1.00
Substances listed in Schedule III		Medazepam — Médazépam	20.00
Substances inscrites au Tableau III		Mefenorex — Méfénorex	60.00
Sustancias incluidas en la Lista III		Meprobamate — Méprobamate — Meprobamato	1 200.00
Amobarbital	100.00	Mesocarb — Mésocarbe — Mesocarbo	25.00
Buprenorphine ^b — Buprénorphine ^b — Buprenorfina ^b	8.00	Methylphenobarbital — Méthylphénobarbital —	
Butalbital	75.00	Metilfenobarbital	100.00
Cathine — Catina	20.00	Methyprylon — Méthyprylone — Metiprilon	200.00
Cyclobarbital — Ciclobarbital	200.00	Midazolam	20.00
Flunitrazepam — Flunitrazépam	1.00	Nimetazepam — Nimétazépam	5.00
Glutethimide — Glutéthimide — Glutetimida	250.00	Nitrazepam — Nitrazépam	5.00
Pentazocine — Pentazocina	200.00	Nordazepam — Nordazépam	15.00
Pentobarbital	100.00	Oxazepam — Oxazépam	50.00
		Oxazolam	40.00
Substances listed in Schedule IV		Pemoline — Pémoline — Pemolina	40.00
Substances inscrites au Tableau IV		Phendimetrazine — Phendimétrazine — Fendimetracina . . .	70.00
Sustancias incluidas en la Lista IV		Phenobarbital — Phénobarbital — Fenobarbital	100.00
Allobarbital — Alobarbital	100.00	Phentermine — Fentermina	15.00
Alprazolam	1.00	Pinazepam — Pinazépam	15.00
		Pipradrol	30.00
		Prazepam — Prazépam	30.00
		Pyrovalerone — Pyrovalérone — Pirovalerona	40.00

^aBy its decision 56/1, the Commission decided to transfer *gamma*-hydroxybutyric acid from Schedule IV to Schedule II of the Convention on Psychotropic Substances of 1971. In accordance with article 2, paragraph 7 of that Convention, the decision became fully effective with respect to each Party on 4 December 2013. — Par sa décision 56/1, la Commission des stupéfiants a décidé de transférer l'acide *gamma*-hydroxybutyrique (GHB) du Tableau IV au Tableau II de la Convention de 1971 sur les substances psychotropes. Conformément au paragraphe 7 de l'article 2 de cette Convention, la décision a pris pleinement effet pour chaque Partie le 4 décembre 2013. — En virtud de la decisión 56/1, la Comisión decidió transferir el ácido *gamma*-hidroxibutírico de la Lista IV a la Lista II del Convenio sobre Sustancias Sicotrópicas de 1971. De conformidad con el artículo 2, párrafo 7, de ese Convenio, la decisión entró en vigor plenamente respecto de cada una de las Partes el 4 de diciembre de 2013.

^bIn the past, the Board calculated one S-DDD to be equal to 1.2 mg of buprenorphine, a measure that reflected the dosage units used for treatment of pain in the late 1990s. In view of the increasing use of higher dosage units of buprenorphine for the treatment of pain and opioid dependence, the Board decided to calculate, as of 2010, one S-DDD to be equal to 8 mg of buprenorphine. Data on buprenorphine expressed in S-DDD in this publication are therefore not comparable with the corresponding data shown for previous years. — Par le passé, l'OICS se fondait, pour la buprénorphine, sur une S-DDD de 1,2 mg, ce qui correspondait à la dose utilisée pour le traitement de la douleur à la fin des années 90. Considérant l'emploi de plus en plus fréquent de doses supérieures pour le traitement de la douleur et de la dépendance aux opioïdes, l'OICS a décidé de se fonder, à compter de 2010, sur une S-DDD de 8 mg. Les données relatives à la buprénorphine qui sont exprimées en S-DDD dans la présente publication ne sont donc pas comparables avec les données correspondantes qui figurent dans les publications des années précédentes. — Anteriormente la Junta calculaba que una S-DDD equivalía a 1,2 miligramos de buprenorfina, cantidad que reflejaba las unidades de dosificación utilizadas para el tratamiento del dolor a finales del decenio de 1990. Debido al uso cada vez más generalizado de unidades de dosificación de buprenorfina más altas para el tratamiento del dolor y la dependencia a los opioides, la Junta decidió calcular, a partir de 2010, que una S-DDD equivale a 8 miligramos de buprenorfina. Por tanto, los datos sobre la buprenorfina expresados en S-DDD en la presente publicación no son comparables a los datos correspondientes a años anteriores.

COMMENTS ON THE REPORTED STATISTICS ON PSYCHOTROPIC SUBSTANCES

Summary

The analysis contained in the present section of the technical publication on psychotropic substances is based on statistical data furnished by Governments. The quality of the analysis depends on the quality of the data provided.

Use of substances included in Schedule I of the 1971 Convention should be limited to scientific research and, in certain cases, for the manufacture of psychotropic substances in other schedules. The isolated use of some substances in Schedule I for the manufacture of other substances has declined in recent years.

Manufacture of methylphenidate and its use for the treatment of attention-deficit hyperactivity disorder (ADHD) continued to increase worldwide. Global manufacture reached a new record, of over 63 tons, in 2012. Although the number of countries reporting manufacture of methylphenidate has increased in recent years, the United States of America remained the leading manufacturer, accounting for almost 97 per cent of the total output. The United States also remained the leading user of methylphenidate in 2012. Outside the United States, the main users of methylphenidate in 2012 were, in descending order, Canada, Germany, Spain, Switzerland, the Netherlands, Brazil, Sweden, Israel, South Africa and Australia.

Manufacture of amphetamines, which are the other central nervous system stimulants in Schedule II of the 1971 Convention, increased further and attained a new record, of over 50 tons (3.4 billion defined daily doses for statistical purposes (S-DDD)), in 2012. This development is due mainly to a significant increase in the manufacture of amphetamine and dexamphetamine in the United States during the year. The United States remained the largest consumer of amphetamines in 2012 in absolute terms, as well as in terms of per capita consumption.

Buprenorphine, an opioid analgesic listed in Schedule III of the 1971 Convention, has been increasingly used since the late 1990s in the treatment of pain and in substitution treatment for opioid addicts. Global manufacture of buprenorphine attained a new record of over 7 tons (919 million S-DDD) in 2012. Global calculated consumption of the substance has also continued to grow. The United States remained the leading user of buprenorphine in 2012, followed by Germany, France, Switzerland, Italy and Spain (in descending order). As in previous years, over 60 countries reported imports of buprenorphine.

A total of 35 benzodiazepines are currently under international control. Of those, 22 are classified as anxiolytics, and 12 are classified as sedative-hypnotics and are used in medical practice for pre-medication and the induction of general anaesthesia. Clonazepam is the only benzodiazepine that is used mainly as an anti-epileptic. Flunitrazepam, a sedative-hypnotic, is the only benzodiazepine that is listed in Schedule III of the 1971 Convention, while the rest of the benzodiazepines are listed in Schedule IV. In 2012, 19 Governments reported manufacture of benzodiazepine-type anxiolytics and 15 Governments reported manufacture of benzodiazepine-type sedative-hypnotics; total reported manufacture of both groups of benzodiazepines decreased in 2012. This decrease may be attributed to the fact that one major manufacturing country did not provide its data on manufacture of benzodiazepines for 2012 to the Board. Alprazolam and diazepam remained, in that order, the most manufactured psychotropic substances in terms of S-DDD. Italy continued to be the leading manufacturer of both groups of benzodiazepines in 2012. Total calculated consumption of benzodiazepines followed the overall trend in global manufacture, showing a gradual decrease over the past three years. The combined total calculated consumption of both categories of benzodiazepines stood at 27 billion S-DDD in 2012.

Of the 12 barbiturates listed in Schedules II, III and IV of the 1971 Convention, the manufacture of five substances—phenobarbital, pentobarbital, butalbital, barbital and amobarbital (in that order)—together accounted for 99 per cent (on average) of the total manufacture of these

barbiturates during the period 2008-2012. Phenobarbital remained the most widely manufactured barbiturate in 2012, accounting for 79 per cent of total manufacture of all 12 barbiturates. China continued to be the leading manufacturer. Other leading manufacturers in 2012 were Hungary, the United States, Denmark and Germany (in descending order). International trade in most barbiturates has been declining during the past five years.

The 14 central nervous system stimulants listed in Schedule IV of the 1971 Convention are used mainly as anorectics or for the treatment of ADHD. Total reported manufacture of this group of substances has been on the rise during the period 2003-2012, and attained 2.6 billion S-DDD in 2012, the United States accounting for over half of the global total, followed by Germany and Italy. The United States remained the leading user of this group of substances, accounting for 74 per cent of global calculated consumption in 2012. Calculated consumption of stimulants in Schedule IV in the Americas remained the highest in the world. In 2012, the highest consumption rates, expressed in S-DDD per 1,000 inhabitants per day, were reported by the United States, followed by Chile and Brazil. Phentermine continues to be the most used substance in this group, accounting for 83 per cent of calculated consumption.

Substances for which global manufacture or international trade in recent years amounted to less than 1 kg are not mentioned separately in the analysis below; however, the data on those substances are included in the relevant group totals, as applicable.

Substances in Schedule I of the 1971 Convention

1. Twenty-eight substances are listed in Schedule I of the 1971 Convention. The use of those substances should be prohibited, pursuant to the provisions of article 7 of the Convention, except for scientific and very limited medical purposes by duly authorized persons in medical or scientific establishments that are directly under the control of or specifically approved by their Governments. This restriction results from the fact that all substances in Schedule I are hallucinogens and/or central nervous system stimulants with very limited or no medical use. In line with this restriction, manufacture and stocks of, as well as trade in, those substances have been extremely limited, with the exceptions noted in the following paragraphs.
2. The 1971 Convention does not foresee use of the psychotropic substances in Schedule I by industry for the manufacture of non-psychotropic substances or products. However, until 2002, 2,5-dimethoxyamphetamine (DMA) was manufactured in the United States of America, exclusively for use in the manufacture of a non-controlled film dye, in amounts of several tons per year. Manufacture of DMA started to decline in 2002, owing to a decrease in the demand for photographic film, and stopped entirely in 2007. Global stocks of DMA, which have been depleted since 2008, stood at 59 grams at the end of 2012.
3. Another substance in Schedule I that is used by industry for the manufacture of non-psychotropic substances is *para*-Methoxy-*alpha*-methylphenethylamine (PMA). During the past decade, Denmark reported intermittent manufacture of PMA, with quantities ranging from 24 to 71 kg, for use in the manufacture of tamsulosin, an active pharmaceutical ingredient that is not under international control. There continues to be limited manufacture of PMA in Denmark and the United States. In 2012, Denmark manufactured 57.5 kg and the United States manufactured 16 grams.
4. Use of the psychotropic substances included in Schedule I for the manufacture of psychotropic substances that are included in other schedules was reported only by the United States. In that country, isomers of tetrahydrocannabinol (THC) listed in Schedule I are used in the manufacture of *delta*-9-tetrahydrocannabinol (*delta*-9-THC), a psychotropic substance listed in Schedule II. *Delta*-8-Tetrahydrocannabinol is the main substance among the isomers in Schedule I manufactured in the United States. During the past decade, reported manufacture in the United States of isomers of THC listed in Schedule I fluctuated between 327 kg in 2005 and 53 kg in 2010. In 2012, the total amount of isomers of THC manufactured in the United States was 60 kg. At the end of 2012, global stocks of such isomers stood at 150 kg, the vast majority of which were held in the United States.

Substances in Schedule II of the 1971 Convention

5. Listed in Schedule II are 17 substances that have little to moderate therapeutic usefulness and whose liability to abuse constitutes a substantial risk to public health. The substances belong to the following groups: central nervous system stimulants, anti-emetics, hallucinogens, sedative-hypnotics, antitussives and antidepressants. In addition to their various applications in human and veterinary medicine, some of these substances are used in industry for the manufacture of other psychotropic substances or for conversion into non-psychotropic substances.

Central nervous system stimulants

6. Total manufacture of central nervous system stimulants in Schedule II fluctuated in the period 2003-2012, as can be seen in figure 1. After decreasing for two consecutive years (2009 and 2010), total reported manufacture of this group of substances picked up again, first slightly in 2011 and then further in 2012, amounting to 5.5 billion S-DDD. This increase is mainly due to a significant increase in manufacture of amphetamine, dexamphetamine and methylphenidate¹ in the United States in 2012. That country accounted for 90 per cent of total output of stimulants in Schedule II during that year. In 2012, methylphenidate's share of total output of stimulants in Schedule II was 38 per cent. Amphetamine and dexamphetamine accounted for 28 and 27 per cent, respectively, of total output. Together with methylphenidate, these substances accounted for 93 per cent of total combined output in 2012.

Amphetamines

7. Both optical isomers of amphetamine (levamphetamine and dexamphetamine) and their racemic mixture (amphetamine), as well as both optical isomers of metamfetamine (levomethamphetamine and metamfetamine) and their racemic mixture (metamfetamine racemate), are listed in Schedule II. Statistical reports on amphetamine, dexamphetamine and metamfetamine have been received by the International Narcotics Control Board from Governments since the 1970s. Statistics for levamphetamine and levomethamphetamine have been available since 1986 and statistics for metamfetamine racemate have been available since 1988, reflecting the different dates on which those substances were brought under international control in the context of the 1971 Convention.

¹Of the other stimulants in Schedule II (4-bromo-2,5-dimethoxyphenethylamine, fenetylline, methylphenidate, phencyclidine and phenmetrazine) only methylphenidate is manufactured and used in significant quantities.

8. In 2012, as a result of a significant increase in the manufacture of amphetamine and dexamphetamine in the United States, the quantity of amphetamines listed in Schedule II that was manufactured worldwide rose to a record amount of 50.5 tons (3.4 billion S-DDD) (see figure 2). In 2012, amphetamine comprised 45 per cent and

Figure 1. Stimulants in Schedule II: total reported manufacture, by substance, 2003-2012

Figure 2. Amphetamines: total reported manufacture, selected countries, 2003-2012

dexamfetamine 43 per cent of the total output of amphetamines, while metamfetamine racemate and levamfetamine represented 6 and 3 per cent, respectively, with the United States accounting for nearly 85 per cent of the total manufacture of amphetamines, France accounting for 12 per cent and Hungary for most of the remainder. France continued to be the sole manufacturer of levamfetamine in 2012, where the substance was used for reconversion into amfetamine.

Use as intermediate substances

9. Amphetamines in Schedule II of the 1971 Convention are frequently used in industry as intermediary products for the manufacture of other substances (see figure 3). The new substances manufactured from amphetamines may be divided into two groups: other psychotropic substances, including those which are optical isomers of the original substance; and substances not controlled under the 1971 Convention. In France and the United States, amphetamines in Schedule II are widely used in industry for conversion into other amphetamines included in that Schedule. In the United States, amfetamine is also used in the synthesis of lisdexamfetamine (l-lysine-d-amfetamine), a prodrug of dexamfetamine, which is used in the treatment of ADHD. In 2012, about 11 tons of lisdexamfetamine were manufactured in the United States. In addition, amphetamines have mainly been converted into substances used as anorectics (benzfetamine, clobenzorex, fenproporex and levopropyl-hexedrine) and antiparkinsonian drugs (selegiline).

Direct medical use

10. For direct medical purposes, amphetamines are used mainly for the treatment of ADHD and narcolepsy. The extensive use of amphetamines for the treatment of obesity has been considerably reduced or discontinued in most countries. While the quantities of amphetamines used for direct medical purposes have been relatively small in most countries, the medical use of amfetamine and dexamfetamine in the United States has increased significantly since the 1990s. A significant increase in the use of amfetamine and dexamfetamine has also occurred in other countries, notably Australia and Canada. While France has traditionally been a major manufacturer of amphetamines, there is very limited medical use of amphetamines in that country, as almost all the amphetamines manufactured there are destined for export.

11. The countries with the highest levels of reported (i.e. furnished by Governments) consumption and calculated medical and industrial² uses of amphetamines, calculated on the basis of statistics provided for 2012³ and expressed in S-DDD per 1,000 inhabitants per day,⁴ are listed in tables 1 and 2 respectively, in order of their rate of use in 2012.

Table 1. Amphetamines: reported consumption rate, selected countries and territories, 2010-2012

Country or territory	S-DDD per 1,000 inhabitants per day		
	2010	2011	2012

Belgium	0.07

Comments on amphetamines, by substance

12. The manufacture of amphetamine gradually increased until it reached a peak of 30 tons in 1998, before falling gradually to 4.3 tons in 2010. In 2011, global manufacture of amphetamine started to rise again, reaching 23 tons in 2012, with the United States and France accounting for 88 and 11.7 per cent, respectively. Amphetamine is used mainly in combination with dexamphetamine in the United States. In 2012, around 2.4 tons of amphetamine were required for such use in the United States, which held about 83 per cent of global stocks of amphetamine in 2012 (9.7 tons). The United States and France, in that order, remained the main exporters of the substance. Total exports of amphetamine in 2012 amounted to 460 kg, the main importers of which were, in descending order, Canada (132 kg), Sweden (14.8 kg) and Switzerland (8.5 kg).

13. The trends in the manufacture of dexamphetamine reflect developments in the United States. During the 1980s, total output was fairly stable, at approximately 350 kg annually. It subsequently increased, although with many fluctuations, to reach a record level of 11 tons in 2009 and then decreased sharply to less than 5 tons in 2010 and 2011. In 2012, manufacture of dexamphetamine in the United States increased to a new record level of 21.4 tons. Stocks of dexamphetamine held in the United States amounted to 9.6 tons in 2012. The United States remained the main user of dexamphetamine for medical purposes, reporting consumption of 10.5 tons for 2012. Such use was also reported by a number of other countries, including Australia (176 kg), Canada (155 kg) and the Netherlands (60 kg). Global exports were 813 kg in 2012, of which France accounted for 670 kg and the United States for 91 kg. About 25 countries reported imports of dexamphetamine in 2012. Germany became the leading importer in that year, accounting for 41 per cent of the global total, followed by Canada, Australia and the Netherlands, in descending order, which together accounted for another 50 per cent of the total.

14. Global reported manufacture of metamfetamine, which amounted to 9.5 tons in 1999, has decreased since that year. The decline has been even more pronounced since 2008, after France and Switzerland ceased manufacturing the substance, with total output reaching less than 3 kg in 2010 and 2011. In 2012, global manufacture rose again and stood at 270 kg, almost all of which was manufactured in the United States (mainly for industrial purposes). Most other countries, which use metamfetamine for medical purposes, cover their needs through imports. The main importer of metamfetamine in 2012 was Spain (1.4 kg).

15. During the period 2003-2012, total reported manufacture of levomethamphetamine fluctuated between no output (in 2009 and 2010) and 4.6 tons (in 2002). The Czech Republic, France, Germany and the United States have traditionally been the main manufacturers of levomethamphetamine. In 2012, total output was about 1.1 tons, with the United States accounting for 980 kg and the Czech Republic for 89 kg. In recent years, on average about 470 kg of levomethamphetamine have been used annually in the United States for the manufacture of nasal inhalants for domestic use, which are exempted in that country from certain control measures in accordance with article 3 of the 1971 Convention. In 2012, 797 kg of levomethamphetamine were used for that purpose.

16. A total of 2.8 tons of metamfetamine racemate was manufactured in 2012. During the period 2008-2012, France and Hungary accounted on average for 63 and 37 per cent of global output, respectively. While in Hungary the substance is mainly used in the manufacture of non-psychoactive substances, the output by other countries has mainly been exported to the United States, where it has either been converted into non-controlled substances or separated into levomethamphetamine and metamfetamine. Global stocks of metamfetamine racemate in 2012 stood at 2.5 tons. International trade in the substance averaged 1.4 tons during the period 2010-2012, with the United States accounting for all imports. Levomethamphetamine has been used mainly for export and has also been converted, in smaller quantities, into selegiline. Metamfetamine obtained during the process of separating it from levomethamphetamine has been added to stocks.

Methylphenidate

17. The use of methylphenidate for medical purposes increased significantly in the 1990s. Methylphenidate is used for the treatment of ADHD, primarily in children. It is also prescribed for the treatment of narcolepsy. The increase in the manufacture and use of methylphenidate is mainly the result of developments in the United States, where the substance is frequently prescribed for the treatment of ADHD and also heavily advertised, including directly to potential consumers. Since 2000, however, the use

of methylphenidate for the treatment of ADHD has also been rising sharply in many other countries. In recent years, concerns have been raised about increasing misuse of preparations containing methylphenidate in some countries.

18. Global manufacture of methylphenidate started to rise rapidly in the 1990s, although with some fluctuations, reaching a record level of 63.2 tons in 2012, the highest amount ever reported (see figure 4). Since the 1990s, the United States has been the leading manufacturer of methylphenidate, increasing its output from 1.8 tons in 1990 to 10 tons in 1995 and then gradually increasing it further to a record level of 61 tons in 2012, which represents almost 97 per cent of global output for that year. Until 2009, the United Kingdom of Great Britain and Northern Ireland was the second largest manufacturer of methylphenidate. In 2010, however, manufacture of the substance in that country amounted to only a few grams. In 2011, the United Kingdom again became the second largest manufacturer, with an output of 3 tons of the substance, but that level dropped again in 2012 to some 6 kg. The other countries reporting manufacture of amounts of methylphenidate exceeding 1 ton in 2012 were Canada (1.2 tons) and Spain (1 ton); their combined output accounted for less than 4 per cent of global manufacture. Most of the methylphenidate manufactured in the United States continued to be used domestically, although exports from that country have increased in recent years. Global stocks of methylphenidate have increased in tandem with the rise in manufacture, increasing to more than 70 tons in 2012. The United States accounted for almost 79 per cent of global stocks at the end of 2012.

19. Despite the fact that manufacture of methylphenidate has spread to several other countries, the medical requirements for methylphenidate outside the United States continue to be met mainly by imports. International trade in methylphenidate increased during the period 1993-2012 from 980 kg to 25 tons. Switzerland was the main exporter of methylphenidate until 2006. Since 2007, however, the United States has been the leading exporter, accounting for 37 per cent of total exports in 2012. Other major exporting countries in 2012 were, in descending order, Switzerland, the United Kingdom, Spain and Germany. The number of countries and territories importing methylphenidate for domestic consumption has been growing. In 2012, 46 countries and territories reported imports of methylphenidate in amounts exceeding 10 kg.

20. The calculated global consumption of methylphenidate has followed an upward trend since 2007, reaching 52.3 tons (1.8 billion S-DDD) in 2011, but dropping to 44.2 tons (1.5 billion S-DDD) in 2012 (see figure 5). This decrease is mainly attributable to developments in the United States, which has traditionally been the leading user of methylphenidate for the treatment of ADHD and accounted for 64 per cent of calculated global consumption of methylphenidate in 2012. In that country, calculated consumption of methylphenidate decreased from 1.2 billion S-DDD in 2011 to 946 million S-DDD in 2012. The main users of methylphenidate in 2012 apart from the United States were, in that order, Canada, Germany, Spain, Switzerland, the Netherlands, Brazil, Sweden, Israel, South Africa and Australia.

Figure 4. Methylphenidate: total reported manufacture, selected countries, 2003-2012

Figure 5. Methylphenidate: calculated consumption, by countries,^a 2003-2012

^aStatistical data submitted by Governments are used to calculate the approximate global consumption in a given year, expressed in S-DDD.

21. The countries and territories with the highest levels of reported (i.e. furnished by Governments) and calculated consumption of methylphenidate (calculated on the basis of statistics provided for 2011 and 2012) are listed in tables 3 and 4, respectively, in order of their level of consumption in 2012.

Table 3. Methylphenidate: reported consumption rate, 2010-2012

Anti-emetics

delta-9-Tetrahydrocannabinol and its stereochemical variants

22. During the period 2008-2012, global manufacture of *delta*-9-THC gradually decreased from 233 kg (7.8 million S-DDD) in 2008 to 54 kg (1.8 million S-DDD) in 2012, led by a decrease in manufacture by the United States, the largest manufacturer of the substance worldwide. In 2012, the United States manufactured 49 kg of *delta*-9-THC, the majority of which was for domestic consumption. Germany remained the second largest manufacturer in 2012, reporting 4.5 kg of manufacture. Stocks held in the United States amounted to 965 kg, accounting for 85 per cent of the global total (1,338 kg) at the end of 2012, followed by Austria (12 per cent of global stocks) and Germany (2 per cent).

23. International trade in *delta*-9-THC grew slightly to 48 kg in 2012. Germany remained the largest exporter, with the United States and Austria being the main importers. The United States, Germany and Austria were the main users of the substance, reporting consumption of 103 kg, 4.8 kg and 2.8 kg, respectively.

Sedative-hypnotics

24. Of the four substances from the group of sedative-hypnotics in Schedule II, three of them, namely, *gamma*-hydroxybutyric acid (GHB), mecloqualone and methaqualone, are neither barbiturates nor benzodiazepines. While mecloqualone has been listed in Schedule II since the adoption of the 1971 Convention, methaqualone, which was initially placed in Schedule IV, was moved to Schedule II in 1979 because of new information gathered over the years indicating its increased abuse potential and decreased medical usefulness. Both mecloqualone and methaqualone are nowadays no longer used in medical practice. The substance GHB, which was added to Schedule IV in 2001, was transferred to Schedule II in 2013. Secobarbital, the only barbiturate in Schedule II, was moved from Schedule III to Schedule II in 1988.

gamma-Hydroxybutyric acid

25. The substance GHB is used in the treatment of narcolepsy and, more rarely, alcoholism. Data for GHB may still be incomplete, as the substance was moved to Schedule II only in 2013. Reported manufacture of GHB increased steadily during the period 2006-2010, reaching a peak of 59 tons in 2010. After a significant drop in 2011, to 12.4 tons, global manufacture increased again, to 38.7 tons, in 2012,

the second-highest amount ever recorded for that substance. These fluctuations are mainly due to fluctuations in manufacture by the United States, a leading manufacturer of the substance. In 2012, reported manufacture of GHB in the United States amounted to 25.6 tons. Other manufacturers of GHB in 2012 were Germany (8.8 tons) and Ukraine (4.3 tons). Global stocks, which had attained 41 tons in 2011, declined to 24 tons in 2012. Italy and the United States remained the two largest holders of those stocks, together accounting for 76 per cent of global stocks in 2012.

26. International trade in GHB increased slightly from 2011 to 2012. In 2012, total reported imports amounted to nearly 16 tons, with Italy, the United Kingdom and France (in descending order) remaining the main importers. Germany, the United Kingdom, the United States and Ukraine (in descending order) were the leading exporters in 2012. Italy, the United States, Ukraine, France, the Russian Federation and Germany (in descending order) had the highest calculated consumption of GHB in 2012.

Secobarbital

27. Since 2000, Germany has been the major manufacturer of secobarbital. In 2012, its output amounted to 870 kg, accounting for over 93 per cent of total global

manufacture (931 kg), while the United States accounted for the remainder (61 kg). Global stocks of secobarbital stood at 833 kg in 2012, with the majority (88 per cent) held in Germany.

28. Global trade volume of secobarbital dropped slightly, from 830 kg in 2011 to almost 750 kg (7.5 million S-DDD) in 2012. Germany remained the leading exporter of the substance, while the United Kingdom continued to be the main importer. The United Kingdom, Germany, Sweden, the United States, Belgium and the Netherlands (in descending order) were the main users in 2012.

Antitussives

Zipeprol

29. The Republic of Korea, which had stopped manufacturing zipeprol in 1999, resumed its manufacture in 2008 and 2009 mainly for domestic consumption. For 2012, no manufacture of the substance was reported. The Plurinational State of Bolivia, the main importer of the substance in previous years, reported consumption of 9.1 kg for 2011 and 9.6 kg for 2012.

Substances in Schedule III of the 1971 Convention

30. Nine substances are listed in Schedule III of the 1971 Convention. According to the scheduling criteria adopted by the World Health Organization, substances in Schedule III are those whose liability to abuse constitutes a substantial risk to public health and which have moderate to great therapeutic usefulness. One substance, cathine, belongs to the group of central nervous system stimulants. Six substances belong to the group of sedative-hypnotics: four barbiturates (amobarbital, butalbital, cyclobarbital and pentobarbital), flunitrazepam and glutethimide. The two remaining substances, buprenorphine and pentazocine, belong to the group of analgesics.

Central nervous system stimulants

Cathine

31. Cathine is used as a stimulant and for industrial purposes. Manufacture of cathine fluctuated considerably

during the period 2003-2012, varying between no output and a peak of 5.9 tons, which was reached in 2007. Until 2003, Germany was the only manufacturer of the substance. Other countries reporting manufacture of cathine in recent years were China and India. From 2007 to 2009, manufacture of cathine declined sharply to 55 kg, all of which was reported by China. In 2010, global output reached 800 kg, of which 500 kg was manufactured in India and 300 kg in China. No manufacture of the substance was reported in 2011 and only some grams were reported in 2012. Global stocks of cathine decreased to 263 kg in 2012; these were held mainly in Germany and Switzerland.

32. India and Germany were the main exporters of cathine in the period 2008-2012. Global exports of the substance averaged 1.5 tons during that time, with a maximum of 3.1 tons in 2008 and a minimum of 872 kg in 2011. In 2012, reported global exports amounted to 1.05 tons. The main importers of cathine during that year, in descending order, were South Africa, Germany and Switzerland.

Sedative-hypnotics listed in Schedule III

33. Classified as sedative-hypnotics, barbiturates used to be prescribed for the treatment of anxiety and stress and, in some cases, as anaesthetics for short surgery interventions (ultra-short-acting substances). Nowadays, they are used mainly as anti-epileptics or for their selective anticonvulsant property. Barbiturates differ in speed of onset, duration of action and potency. Like benzodiazepines, barbiturates encountered on the illicit market have usually been diverted from licit circuits rather than synthesized in clandestine laboratories.

Amobarbital, butalbital, cyclobarbital and pentobarbital

34. During the period 2003-2012, global manufacture of amobarbital, butalbital, cyclobarbital and pentobarbital fluctuated between 0.82 billion S-DDD and 1.27 billion S-DDD. For 2012, a global total of 862 million S-DDD was recorded, the lowest amount since 2006 as a result of decreased manufacture in Denmark. While manufacture of amobarbital has shown a downward trend in recent years, that of pentobarbital has increased (see figure 6). As in previous years, manufacture in China, Denmark, Germany and the United States accounted for almost 99 per cent of the total. Figure 7 shows the share of the main manufacturing countries, in total output, during the period 2008-2012.

35. After reaching a record high level in 2011 (51.4 tons or 514 million S-DDD), global manufacture of pentobarbital edged down slightly to 50.3 tons (503 million S-DDD) in 2012, owing to decreased manufacture in the United States. Total manufacture in the United States and Germany accounted for 91 per cent of the global total in 2012. Third came Denmark, followed by Canada and Japan. Total stocks of pentobarbital reached 38 tons (381 million S-DDD) in 2012, with about 41 per cent of them held in the United States, 28 per cent in Germany and 12 per cent in the United Kingdom. In 2012, the largest user of pentobarbital continued to be the United States, followed by Germany, France, Australia, Canada, Denmark and the Netherlands.

36. After increasing for two consecutive years in 2009 and 2010, the total volume of international trade in pentobarbital stabilized at 31 tons (309 million S-DDD) in 2012. Accounting for 41 per cent of global exports in 2012, Germany continued to be the top exporter, followed by the United States (15 per cent) and the Netherlands (11 per cent). France, Canada and the Netherlands, together, accounted for half of global imports in 2012.

37. Global manufacture of butalbital experienced a significant decrease in 2012, down from its record high of nearly 40 tons (532 million S-DDD) in 2011 to 23 tons (307 million S-DDD) in 2012, owing to decreased manufacture in Denmark and the United States. Despite a substantial drop in its manufacture, Denmark remained the

Figure 6. Barbiturates listed in Schedule III: total reported manufacture, by substance, 2003-2012

Figure 7. Barbiturates listed in Schedule III: total reported manufacture, selected countries, 2008-2012

leading manufacturer (61 per cent of the global total), followed by the United States (37 per cent). Another significant manufacturer, Germany, did not report manufacture in 2011 and 2012. Manufacture in Denmark continued to be mainly for overseas markets, while that in the United States was predominately for domestic consumption. In that country, 3.5 tons (47 million S-DDD) were used in 2012 for the manufacture of preparations exempted from certain control measures, in accordance with article 3 of the 1971 Convention. Total volume of trade increased from 21.4 tons (286 million S-DDD) in 2011 to 31 tons (413 million S-DDD) in 2012, with Denmark remaining the largest exporter and Italy being the main importer. Global stocks of butalbital dropped to 22.3 tons (297 million S-DDD) in 2012, with around 63 per cent of that amount held in the United States and the remainder held mainly in Denmark and Italy.

38. Global manufacture of amobarbital fell from 9.4 tons (94 million S-DDD) in 2011 to 5 tons (50 million S-DDD) in 2012. This decrease can be attributed to a marked decrease in manufacture by China and no manufacture by Japan, the two main countries manufacturing and using amobarbital. As in previous years, the majority of the quantities manufactured in China was for domestic use. Global stocks stood at 950 kg (9.5 million S-DDD) in 2012, most of which were held in China and the remainder in the United Kingdom. Total international trade remained at about the same level, with China being the main exporter and the United Kingdom being the main importer. Total calculated consumption stood at 3.3 tons (32.8 million S-DDD) in 2012, almost all of it consumed in China.

39. Cyclobarbital was manufactured and used mainly in Europe. After Germany and Latvia stopped manufacturing the substance in 2003, Poland became the sole manufacturer of cyclobarbital. After recording a manufacture of 393 kg (2 million S-DDD) of cyclobarbital in 2011, manufacture in Poland rose to 484 kg (2.4 million S-DDD) in 2012. Of that amount, Poland exported 220 kg (1.1 million S-DDD), mainly to other countries in Europe. Amounting to almost 70 per cent of the global imports in 2012, the Russian Federation continued to be the main importer of cyclobarbital, with the remaining 13 per cent and 12 per cent imported by Georgia and Latvia, respectively.

Flunitrazepam

40. Flunitrazepam remains one of the most frequently abused benzodiazepines. The substance is diverted mainly from domestic distribution channels. Preparations containing flunitrazepam have often been diverted from the licit market and smuggled into countries where there is an illicit demand for such preparations. Because it had frequently been diverted and abused, flunitrazepam was transferred from Schedule IV to Schedule III in 1995. Several

countries, including major manufacturers and importers of the substance, have adopted strict control policies for flunitrazepam, in close cooperation with the pharmaceutical industry. Most of the preparations purportedly containing flunitrazepam that are sold on the illicit market are counterfeit products that do not contain that substance.

41. In medical practice, flunitrazepam, similarly to diazepam, has been used for pre-medication and for general anaesthesia. Prior to 1996, flunitrazepam was manufactured in several countries. After 1996, only Italy and Switzerland reported its manufacture; in 2010 and 2011, India also reported some manufacture of flunitrazepam. The manufacture of flunitrazepam in Switzerland, the main manufacturer of the substance, has fluctuated greatly; in some years, such as in 2005 and 2008 and during the period 2010-2011, no manufacture of the substance took place in that country. Those fluctuations are reflected in total global manufacture of flunitrazepam (see also paragraph 84 and figures 20 and 21 below), which in 2012 stood at 1.5 tons, with Switzerland accounting for 80 per cent of output (1.2 tons), followed by Italy (303 kg) and Germany (1.6 kg). Stocks of flunitrazepam held by manufacturers amounted to 1.3 tons in 2012, held mainly in Switzerland (82 per cent), Italy (11 per cent) and Brazil (3 per cent).

42. International trade in flunitrazepam averaged 1.1 tons per year during the five-year period 2008-2012, and stood at 1.2 tons in 2012. Italy and Switzerland were the leading exporters of flunitrazepam, together accounting on average for 91 per cent of global exports of the substance during the period 2008-2012. More than 50 countries reported imports or use of flunitrazepam during the period 2010-2012. Japan remained the leading importer of flunitrazepam in 2012, importing 702 kg or 67 per cent of global imports of the substance. Switzerland, Uruguay, Nigeria, Brazil and Germany (in descending order) reported imports ranging from 34 to 93 kg, accounting together for 26 per cent of global imports of the substance in 2012. Global calculated consumption of flunitrazepam increased by 2 per cent compared with 2011 and amounted to 909 kg (909 million S-DDD) in 2012, most of which was consumed in Japan (702 million S-DDD). Uruguay (36.7 S-DDD), Japan (15.2 S-DDD) and Austria (6.6 S-DDD) had the highest calculated rates of consumption measured in S-DDD per 1,000 inhabitants per day.

Analgesics listed in Schedule III

Buprenorphine

43. Buprenorphine belongs to the family of opioids used mainly as analgesics. As shown in figure 8, global

manufacture of buprenorphine started to increase gradually beginning in the late 1990s, as the substance began to be used in higher doses for the treatment of pain and opioid addiction. After a significant drop in 2010, global manufacture increased again and attained a new record, with a total of 7,353 kg (919 million S-DDD) in 2012 reported by 13 countries, including the major manufacturing countries: the United Kingdom (4,608 kg), the Czech Republic (749 kg), Belgium (655 kg), Switzerland (453 kg), Australia (400 kg) and Germany (273 kg). Global stocks of the substance amounted to about 6.7 tons in 2012, an increase of almost 96 per cent from 2011. The majority of the stocks were held, in descending order, in the United Kingdom, the United States, Germany, the Czech Republic, Switzerland, Australia and France.

44. The volume of trade in buprenorphine has continued to increase since 1993, reaching a total of 7.2 tons in 2012, with over 60 countries reporting imports of the substance. Major importers in 2012 included the United States (4,749 kg), Germany (886 kg), France (510 kg), the United Kingdom (158 kg), Spain (119 kg) and Italy (104 kg). Among those countries, the United States reported a significant increase in imports over the 2011 level. The United Kingdom (3,233 kg), Belgium (731 kg), Germany (566 kg), the

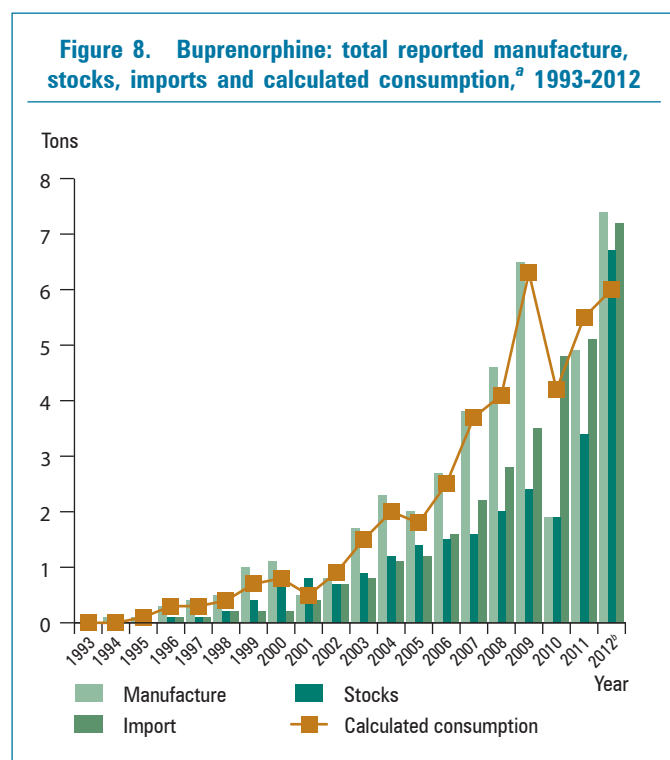

Czech Republic (526 kg), Australia (431 kg), Switzerland (239 kg) and France (100 kg) were the major exporters in 2012, together accounting for 97 per cent of total global exports.

45. Global calculated consumption of buprenorphine increased from 5.5 tons (681 million S-DDD) in 2011 to over 6 tons (756 million S-DDD) in 2012. With 524 million S-DDD, the United States accounted for 69 per cent of global calculated consumption in 2012, followed by Germany (9 per cent), France (5 per cent), Switzerland (4 per cent) and Spain and Italy (2 per cent each). The calculated consumption of buprenorphine in S-DDD per 1,000 inhabitants per day is shown in part three, table IV.5, of the present publication. Buprenorphine is used in several countries in detoxification and substitution treatment programmes for opioid dependence, including in Australia, Austria, Denmark, France, Germany, Hungary, Ireland, Malaysia, Switzerland and the United States. Diversions of preparations of buprenorphine, mainly from domestic distribution channels, have been reported by a few countries. Abuse of the substance, particularly among opioid addicts, has also been reported.

Pentazocine

46. Pentazocine is an opioid analgesic with properties and uses similar to those of morphine. Global total manufacture of the substance fluctuated during the period 2003-2011 between a low of 2.7 tons (13 million S-DDD) in 2003 and a high of 8.5 tons (42 million S-DDD) in 2009, mainly as a result of fluctuations in the total output of India and Italy, the two major manufacturing countries. In 2012, total manufacture of the substance amounted to 685 kg, of which 512 kg was manufactured in the United States. The pentazocine manufactured in the United States was mainly for domestic use. Italy and China, the two other major manufacturers in 2012, reported manufacture of 130 kg and 42 kg, respectively. India, which reported the manufacture of 6.7 tons of the substance for 2011, did not report manufacture of the substance in 2012. Global reported stocks of the substance decreased by 50 per cent from 2011, to 2,717 kg in 2012, as a result of absence of stock data from India and decreased stocks held in the United States. Major users of the substance in 2012 included, in descending order, the United States, Nigeria, Japan, Canada and Belgium.

47. Global trade in pentazocine has been declining since 2009. Total exports further decreased from 2,320 kg in 2011 to 1,072 kg in 2012. The largest exporter in 2012 was Italy (800 kg). Major importers in 2012 were the United States, Nigeria, Pakistan and Portugal, in descending order.

^a Statistical data submitted by Governments are used to calculate the approximate global consumption in a given year, expressed in S-DDD.

^b The data for 2012 are incomplete.

Substances in Schedule IV of the 1971 Convention

48. Sixty-two substances with various applications in medicine are listed in Schedule IV. They belong to the following groups: central nervous system stimulants (14 substances); benzodiazepine-type anxiolytics (22 substances); other anxiolytics (1 substance); benzodiazepine-type sedative-hypnotics (11 substances); benzodiazepine-type anti-epileptics (1 substance); barbiturate-type sedative-hypnotics and anti-epileptics (7 substances); other sedative-hypnotics (5 substances); and analgesics (1 substance).

Central nervous system stimulants

49. Fourteen central nervous system stimulants are listed in Schedule IV: amfepramone, aminorex, benzfetamine, etilamfetamine, fencamfamin, fenproporex, mazindol, mefenorex, mesocarb, pemoline, phendimetrazine, phentermine, pipradrol and pyrovalerone. The stimulants in Schedule IV are essentially used as anorectics or for the treatment of ADHD.

50. Reported manufacture of central nervous system stimulants in Schedule IV has been on the rise during the period 2003-2012, in spite of many fluctuations (see figure 9). Those fluctuations were mainly the result of developments in Brazil, Germany and the United States, which have traditionally been the main manufacturers. In 2012, global manufacture of this group of substances amounted to 2.6 billion S-DDD, the United States accounting for over half of the global total, followed by Germany and Italy (see figure 10).

51. In 2012, manufacture of phentermine (2.2 billion S-DDD) accounted for 84 per cent of total reported manufacture of all stimulants in Schedule IV, while the reported manufacture of mazindol (269 million S-DDD) accounted for 10 per cent, amfepramone (131 million S-DDD) accounted for 5 per cent and phendimetrazine (25 million S-DDD) accounted for 1 per cent (see figure 11). Reported manufacture of the other central nervous system stimulants in Schedule IV (benzfetamine, fenproporex and pemoline) accounted each for less than 1 per cent of total reported manufacture. No manufacture has been reported for the other stimulants in Schedule IV (aminorex, etilamfetamine, fencamfamine, mefenorex, mesocarb, pipradrol and pyrovalerone).

^aStatistical data submitted by Governments are used to calculate average annual consumption for a three-year period.

Figure 12. Central nervous system stimulants in Schedule IV: calculated global consumption,^a by substance, 2003-2012

^aStatistical data submitted by Governments are used to calculate the approximate global consumption in a given year, expressed in S-DDD.

52. The fluctuations in total calculated global consumption of central nervous system stimulants listed in Schedule IV (see figure 12) mainly reflect changes in the use of phentermine in the United States and the use of amfepramone and fenproporex in Brazil. A total of 1.9 billion S-DDD of central nervous system stimulants listed in

Schedule IV were used in 2012. Of those, phentermine (1.58 billion S-DDD) accounted for 82.9 per cent, followed by mazindol (192 million S-DDD, or 10 per cent), fenproporex (59.5 million S-DDD, or 3.1 per cent), amfepramone (52 million S-DDD, or 2.7 per cent) and phendimetrazine (13.2 million S-DDD, or 0.7 per cent) (see figure 12). About 74 per cent of global calculated consumption of stimulants in Schedule IV in 2012 was accounted for by the United States (1.41 billion S-DDD), followed, in descending order, by Argentina, Australia and Brazil.

53. Calculated consumption of stimulants in Schedule IV in the Americas remained the highest in the world, at approximately the same levels as a decade ago (see figure 13). Decreases in the use of stimulants in Brazil achieved since 2006 have been almost offset by rising consumption levels observed in the United States. Levels of consumption decreased in Asia and Europe during the period 2010-2012 compared with the period 2006-2008, but increased markedly in Africa and, in particular, Oceania, where consumption of anorectics has increased significantly in some countries. In 2012, the highest consumption rates, expressed in S-DDD per 1,000 inhabitants per day, were reported by the United States (11.6 S-DDD), followed by Chile (1.2 S-DDD) and Brazil (0.5 S-DDD). Among the countries and territories that did not report consumption data, the highest calculated consumption rates, expressed in S-DDD per 1,000 inhabitants per day, were observed in Argentina (12.1 S-DDD), Australia (9.1 S-DDD) and China, Hong Kong Special Administrative Region, and Singapore (3.4 S-DDD each).

54. Phentermine has always been the most widely manufactured substance in the group of stimulants in Schedule IV. During the period 2003-2012, total reported manufacture of the substance gradually increased from 9 tons in 2003 to 34.4 tons in 2011, and stood at 32.6 tons in 2012, with the United States accounting for 20.7 tons, followed by Germany (7.22 tons) and Italy (4.7 tons).

55. International trade in phentermine also increased, reaching 17 tons in 2012. In recent years, the main exporter of the substance has been Germany (reporting exports of almost 7 tons in 2012), followed, in descending order, by Italy, the United States and Australia. The United States has been the main importer of phentermine in recent years, importing almost 8 tons in 2012. Imports of phentermine in quantities of more than 1 kg were reported in 2012 by 23 countries and territories.

56. Global manufacture of phendimetrazine decreased from 7.6 tons in 2010 to 1.8 tons in 2012. This decrease reflects developments in Italy, the main manufacturer of phendimetrazine in the period 2007-2011. Manufacture of phendimetrazine in that country declined gradually from 5.2 tons in 2009 to 733 kg in 2012. Phendimetrazine manufactured in Italy is mainly destined for export. Global exports decreased to 1.1 tons in 2012, of which Italy accounted for 58 per cent. Traditionally, the United States, followed by the Republic of Korea, have been the main importers and users of the substance. In 2012, Germany (43 kg), South Africa (26 kg) and Switzerland (4 kg) were the only countries reporting imports of phendimetrazine in quantities of more than 1 kg. No imports of phendimetrazine were reported by the Republic of Korea for 2011 and 2012.

57. Total reported manufacture of amfepramone, which had averaged 22 tons per year during the period 2003-2007, decreased beginning in 2008 to about 9 tons per year on average. In 2012, total reported manufacture of amfepramone amounted to 10 tons. Only three countries reported having manufactured amfepramone in 2012: Switzerland (6.9 tons), Italy (2.4 tons) and the United States (570 kg). Brazil, which had reported the manufacture of 4.8 tons for 2011, submitted no report for 2012. Switzerland was the main exporter of amfepramone during the decade leading up to 2012, exporting 2.5 tons per year on average during the period 2008-2011. In 2012, Switzerland exported almost 7 tons, accounting for 83 per cent of global exports of the substance in that year. The largest imports of amfepramone were reported by the United States (5.3 tons), Germany (816 kg), the United Kingdom (402 kg) and Chile (289 kg). Nine other countries reported imports of amfepramone in quantities of more than 1 kg in 2012.

58. With the exception of 2005 and 2006, when manufacture of benzfetamine was reported by Ireland, Italy and Switzerland, the United States was the sole manufacturer of

benzfetamine during the decade leading up to 2010. In 2011 and 2012, the United States and Italy together reported a total manufacture of 454 kg and 104 kg. International trade in benzfetamine remained limited in 2012, with only three countries reporting imports of the substance, including the United States and the United Kingdom. The United States was also the major consumer of benzfetamine in the period 2003-2012, reporting consumption of 137 kg for 2012.

59. Global reported manufacture of fenproporex has declined steadily since 2003, from 10 tons in that year to 1.4 tons in 2011, owing mainly to the decrease in manufacture reported by Belgium and Brazil, which were the major manufacturing countries in that period. In 2012, total output of fenproporex dropped to 6 kg, all of which was manufactured by Australia. Total reported imports of the substance, which had averaged 3.4 tons per year during the period 2006-2010, dropped to 313 kg in 2012, almost all of that amount imported by Brazil.

60. Argentina has been the main manufacturer of mazindol since 2003. It reported an annual average output of 160 kg of the substance during the period 2003-2012. In addition to Argentina, Brazil has intermittently manufactured mazindol, in amounts averaging 50 kg per annum. In 2012, Argentina manufactured 178 kg and Brazil manufactured 91 kg. Brazil held most of the global stocks of the substance at the end of 2012 (135 kg). Total exports of mazindol amounted to 39 kg, with Brazil accounting for 23 kg and Switzerland and the United Kingdom for the remainder.

61. No manufacture of pemoline was reported between 2005 and 2007. Since 2008, global manufacture of the substance has fluctuated between 392 kg in 2008 and 4 grams in 2009, reflecting developments in the Netherlands, which has been virtually the only country manufacturing pemoline since 2008. In 2012, total output of the substance amounted to 387 kg, all reported by the Netherlands, which has also been the main exporter. Stocks of pemoline have declined steadily, from 7.5 tons in 2004 to 188 kg at the end of 2012. During the decade ending in 2012, imports of pemoline averaged 338 kg a year. In 2012, total imports of pemoline stood at 360 kg, of which Japan accounted for 320 kg and the Netherlands for the remainder. In addition to being used as a stimulant, pemoline is used for the treatment of ADHD.

Benzodiazepines

62. Thirty-three benzodiazepines were included in Schedule IV in 1984. Midazolam was added to Schedule IV in 1990 and brotizolam was added in 1995. Flunitrazepam was transferred from Schedule IV to Schedule III in 1995. During the decade ending in 2012, practically all countries and territories that reported to the Board manufactured or

traded in benzodiazepines in quantities of more than 1 kg at least once. Benzodiazepines are frequently diverted for subsequent smuggling and abuse.

Benzodiazepine-type anxiolytics

63. Twenty-two benzodiazepines are generally classified as anxiolytics. In the past decade, total reported manufacture of this group of substances fluctuated in the range of 19.4 billion and 29.9 billion S-DDD, averaging 23 billion S-DDD per year during the period 2003-2011 (see figure 14). Those fluctuations mainly reflect fluctuations in the manufacture of alprazolam and diazepam, the main substances in this group, which together accounted, on average, for almost 60 per cent of the total in the period 2008-2012. Global manufacture of this group of substances amounted to 16.1 billion S-DDD in 2012, which is 40 per cent lower than in 2011. The decline in 2012 is a result of the fact that data on manufacture of this group of substances from some countries, most importantly India, are missing. In 2011, manufacture in India accounted for 27 per cent of global manufacture of benzodiazepine-type anxiolytics.

64. In 2012, alprazolam accounted for 29 per cent (4.6 billion S-DDD) of total reported manufacture of benzodiazepine-type anxiolytics; diazepam for 26 per cent (4.3 billion S-DDD); lorazepam for 21 per cent (3.3 billion S-DDD); bromazepam for 8 per cent (1.3 billion S-DDD); chlordiazepoxide and oxazepam for 3 per cent each; clobazam for 2 per cent; and clorazepate and nordazepam for 1 per cent

each (see figure 15). The remaining substances in that group together accounted for 6 per cent of total reported manufacture. Up to 2007, fludiazepam had been intermittently manufactured in Japan; in the first reported manufacture since then, Switzerland reported manufacture of 7 grams of that substance in 2012. No manufacture of camazepam or pinazepam was reported for 2012, small quantities of which were last manufactured in 1991 and 2011, respectively. As shown

Figure 15. Benzodiazepine-type anxiolytics: share of total reported manufacture, by substance, 2012

Figure 14. Benzodiazepine-type anxiolytics: total reported manufacture, by substance, 2003-2012

^aThe data for 2012 are incomplete.

Figure 16. Benzodiazepine-type anxiolytics: reported manufacture, selected countries, 2003-2012

^aThe data for 2012 are incomplete.

in figure 16, China, India and Italy were the leading manufacturers of benzodiazepine-type anxiolytics in the period 2003-2011. In 2012, owing to the absence of data from India for that year, Italy (7 billion S-DDD), China (1.9 billion S-DDD), Finland (1.8 billion S-DDD) and France (1.5 billion S-DDD) together accounted for 76 per cent of global manufacture of that group of substances (see figure 17).

Figure 17. Benzodiazepine-type anxiolytics: share of total reported manufacture, by country, 2012

65. Total approximate calculated consumption of benzodiazepine-type anxiolytics followed the overall trend in global manufacture. In 2012, the global calculated consumption for this group of substances amounted to 20.4 billion S-DDD (see figure 18). The United States, Brazil, Belgium, France, Spain, Japan and Italy (in descending order) were the largest consumers of this group of substances, in absolute terms, in 2012. The calculated consumption of benzodiazepine-type anxiolytics, expressed in S-DDD per 1,000 inhabitants per day, is shown in part three, table IV.3, of the present publication, with Slovenia (984 S-DDD), Belgium (360 S-DDD), Ireland (177 S-DDD), Finland (107 S-DDD) and Portugal (99 S-DDD) having the highest rates. Until 2010, Europe was consistently the region with the highest calculated average national consumption rates for benzodiazepine-type anxiolytics (see figure 19). The sharp increase in consumption levels in Oceania during the period 2010-2012 is the result of a marked increase in the imports and calculated consumption of alprazolam in Australia for 2011.

66. In 2012, total reported manufacture of alprazolam amounted to 4.6 tons, a decline of 62 per cent compared with 2011 due to significantly lower manufacture in the United States and because no data on manufacture were submitted by India, which had contributed 5.4 tons to global output in 2011. The main manufacturers of alprazolam in 2012 were Finland (1.7 tons), Italy (1.3 tons), France (989 kg) and China (251 kg), which together accounted for 92 per cent of global manufacture. They were

Figure 18. Benzodiazepine-type anxiolytics: calculated global consumption,^a 2003-2012

Figure 19. Benzodiazepine-type anxiolytics: average national consumption,^a by region, 2004-2012

^aStatistical data submitted by Governments are used to calculate the approximate global consumption in a given year. These consumption figures are expressed in defined daily doses for statistical purposes (S-DDD).

^bThe data for 2012 are incomplete.

^aStatistical data submitted by Governments are used to calculate the average annual consumption for a three-year period.

followed by Brazil (132 kg), Pakistan (90 kg), the United States (90 kg, down from almost 2 tons in 2011), Canada (41 kg), Argentina (30 kg) and the Russian Federation (5 kg). Global stocks of the substance have been relatively stable in the past five years, averaging 6.1 tons per year during the period 2008-2012. In 2012, the main stockholders, in descending order, were the United States, Finland, Canada, Italy and Brazil.

67. Alprazolam is available in many countries and all regions. Global exports have shown an upward trend during the past 10 years, rising from 4.9 tons in 2003 to 11.8 tons in 2011. In 2012, global reported exports fell to 10.8 tons. India, the United States, Italy, Finland, France and Belgium, in descending order, were the main countries reporting exports of the substance in 2012, their combined total accounting for 87 per cent of global exports. More than 100 countries reported imports of the substance during 2012. The main importers of alprazolam continued to be the United States (4.4 tons), Belgium (2 tons) and Italy (1.2 tons), mainly for re-export. Those countries were followed, in descending order, by Slovenia, Argentina, Brazil, Hungary and Switzerland. Global calculated consumption, which had averaged 10.3 billion S-DDD per year during the period 2008-2011, decreased to 8.9 billion S-DDD in 2012. The countries having the largest calculated consumption of alprazolam in absolute terms in 2012 were the United States (2.8 billion S-DDD), Belgium (1.2 billion S-DDD), Slovenia (727 million S-DDD) and Argentina (542 million S-DDD). Measured in S-DDD per 1,000 inhabitants per day, Slovenia (984 S-DDD), Belgium (309 S-DDD), Ireland (132 S-DDD), Hungary (57 S-DDD), Uruguay (44 S-DDD) and Argentina (37 S-DDD) had the highest rates of calculated consumption.

Diazepam

68. Diazepam continues to be the most traded substance in the group of benzodiazepine-type anxiolytics and is consumed in all regions of the world. Together with alprazolam, diazepam is among the benzodiazepines most often diverted and abused. Global reported manufacture of diazepam, which in the past decade had fluctuated between 43.5 tons in 2009 and 113 tons in 2004, fell to 43 tons in 2012, its lowest level in the past decade, mainly because no data on manufacture for 2012 were submitted by India, a major manufacturer and exporter of this substance, which in 2011 manufactured 7.1 tons of the substance. In 2012, Italy (17.7 tons), China (16.1 tons), Brazil (6.9 tons) and the United States (1.4 tons) accounted for 98 per cent of total reported manufacture. Global reported stocks of diazepam stood at 35.8 tons in 2012, held mainly in China, Italy, Brazil, Switzerland and the United Kingdom, in descending order.

69. International trade in diazepam, which averaged 57.2 tons annually during the 10-year period 2003-2012, amounted to 54.7 tons in 2012. Italy (19.4 tons) and China (9.5 tons) remained the leading exporters of the substance in 2012, followed by Switzerland and Denmark (5.6 tons each) and India (4 tons); together, those countries accounted for 81 per cent of global exports in 2012.

70. Practically all countries and territories imported diazepam at least once in the period 2008-2012. About 100 countries and territories reported imports of diazepam of more than 1 kg for 2012, the main importers being Ghana (5.8 tons), the United States (4.7 tons) and the Democratic Republic of the Congo (3.9 tons). Switzerland, Denmark and Spain imported 3.4 tons, 3.2 tons and 3 tons, respectively, mainly for re-export. Global calculated consumption of diazepam continued to decrease, standing at 4.6 billion S-DDD in 2012. Brazil (734 million S-DDD), the United States (648 million S-DDD), Ghana (579 million S-DDD), the Democratic Republic of the Congo (392 million S-DDD) and the United Kingdom (387 million S-DDD) had the highest calculated consumption of diazepam in 2012. Measured in S-DDD per 1,000 inhabitants per day, Ghana (65.1 S-DDD), Croatia (35.8 S-DDD), the former Yugoslav Republic of Macedonia (23.2 S-DDD) and Uruguay (18.9 S-DDD) had the highest calculated rates of consumption in 2012.

Lorazepam

71. Total reported manufacture of lorazepam was fairly stable during the period 2009-2011, averaging 10.9 tons per year. In the recent past, Italy, Germany and India were the three main manufacturers of the substance. In 2012, total reported output of the substance stood at 8.4 tons, of which Italy accounted for 64 per cent and Germany for 25 per cent. India had traditionally reported manufacture of lorazepam every year, with an output of 1.2 tons reported for 2011; however, no manufacture was reported by that country for 2012. Other countries reporting manufacture of lorazepam in 2011 were the United States (296 kg), Canada (276 kg), Poland (209 kg), Israel (68 kg), China (49 kg), Spain (34 kg) and Costa Rica (23 kg). Global reported stocks of lorazepam stood at 8.3 tons in 2012, mainly held, in descending order, in Germany, Italy, the United States and Ireland.

72. In 2012, total reported exports of lorazepam stood at 10.9 tons, 4 per cent lower than in 2011. The main exporters of lorazepam in 2012 were Italy, Germany, India, Ireland, Belgium and Hungary (in that order), which together accounted for approximately 94 per cent of total exports of the substance. About 60 countries and territories reported imports of lorazepam of more than 1 kg for 2012, the main importers being the United States (2.2 tons), Ireland

(1.2 tons), Belgium (1.1 tons, mainly for re-export), Spain (1 ton) and Italy (758 kg, for re-export), which together accounted for 60 per cent of all reported imports of the substance. During the period 2003-2012, global calculated consumption averaged 3.8 billion S-DDD per year. In 2012, it amounted to 3.3 billion S-DDD, with the highest levels being recorded for the United States (783 million S-DDD), Spain (382 million S-DDD), Italy (346 million S-DDD) and Canada (238 million S-DDD). Ireland (33.6 S-DDD), Belgium (27.7 S-DDD), Portugal (24.9 S-DDD), Spain (23.1 S-DDD), Austria (22.6 S-DDD) and Serbia (21.6 S-DDD) had the highest calculated rates of consumption, measured in S-DDD per 1,000 inhabitants per day.

Bromazepam

73. During the period 2003-2012, total reported manufacture of bromazepam fluctuated significantly within the range of 7.3 tons (2005) and 18.3 tons (2008), averaging 13.8 tons per year. In 2012, total reported manufacture of bromazepam stood at 12.7 tons, the main manufacturers remaining Italy (5.9 tons) and Switzerland (5.8 tons), followed by Brazil (931 kg) and Canada (108 kg). No other country reported manufacture of the substance in 2012, including India (the other manufacturer of bromazepam in the recent past), for which data on manufacture for 2012 are missing. Global reported stocks of bromazepam were fairly stable during the past five years, averaging 14.1 tons per year during the period 2008-2012. Most of the stocks in 2012 were held in Switzerland, Italy, France and Brazil, in that order.

74. International trade in bromazepam was stable during the period 2003-2012, with global exports averaging 16.8 tons annually. In 2012, as in previous years, the main manufacturing countries (Italy and Switzerland) were also the leading exporters of the substance, jointly accounting for 78 per cent of total exports. Ninety-four countries reported imports of bromazepam in 2012, with 23 of those countries reporting imports of more than 100 kg. France (3.2 tons, mainly for domestic consumption), Switzerland (2.1 tons, for re-export) and Italy (1.4 tons, for re-export) remained the main importers of bromazepam in 2012, jointly accounting for 43 per cent of total reported imports. Five further countries, namely Pakistan (951 kg), Germany (799 kg), Brazil (750 kg), Serbia (750 kg) and Japan (739 kg), accounted for 26 per cent of global imports during 2012. Global calculated consumption of bromazepam was fairly stable during the period 2003-2012, averaging 1.3 billion S-DDD. Total consumption decreased slightly, from 1.4 billion S-DDD in 2011 to 1.2 billion S-DDD in 2012, with France (251 million S-DDD), Brazil (153 million S-DDD), Italy (85 million S-DDD), Japan (74 million S-DDD) and Pakistan (73 million S-DDD) having the highest levels, in absolute terms.

Chlordiazepoxide

75. Since peaking in 2009 at 40.4 tons, total reported manufacture of chlordiazepoxide has decreased steadily, falling to 13.6 tons in 2012. Italy (11.3 tons) and China (1.8 tons), traditionally the main manufacturers of the substance, accounted for 97 per cent of the total reported output. Only three other countries reported significant manufacture of the substance in 2012: Canada (160 kg) and Poland and the United States (147 kg each). Data on manufacture in 2012 were missing from India, another major manufacturer of chlordiazepoxide, which had reported manufacture of 7.7 tons of the substance for 2011. Global reported stocks of this substance stood at 12.5 tons in 2012, held mainly in Italy, China, the United States, Brazil and Switzerland, in that order.

76. Global exports of chlordiazepoxide declined from 18 tons in 2011 to 16.9 tons in 2012. Italy (8.3 tons), China and India (2.5 tons each) and Switzerland (1.6 tons) were the largest exporters of chlordiazepoxide in 2012, jointly accounting for 88 per cent of global exports. More than 100 countries reported imports of chlordiazepoxide in the five-year period 2008-2012. Switzerland (2 tons), the Islamic Republic of Iran (1.4 tons), the United States (1.2 tons), Brazil (770 kg) and Ghana (645 kg) were the main importers of the substance in 2012, accounting together for 48 per cent of the global total. Calculated global consumption of the substance, after having peaked at 1.2 billion S-DDD in 2009, continued to decrease and fell from 660 million S-DDD in 2011 to 300 million S-DDD in 2012. The countries with the highest levels of consumption in 2012 were the Islamic Republic of Iran (45.2 million S-DDD), the United States (28.9 million S-DDD) and Italy (23.9 million S-DDD); while the highest rates of consumption measured in S-DDD per 1,000 inhabitants per day were recorded for Jordan (4.9 S-DDD), Iceland (2.5 S-DDD), Ghana (2.4 S-DDD) and the Islamic Republic of Iran (1.6 S-DDD).

Oxazepam

77. During the period 2003-2012, total reported manufacture of oxazepam fluctuated within the range of 20.3 tons in 2007 and 34.4 tons in 2003, averaging 25.1 tons per year. Global reported manufacture of the substance declined to 22.7 tons in 2012, partly owing to the lack of data from India, which had reported output of 1.6 tons for 2011. Italy (20.1 tons), which manufactures the substance mainly for export, Canada (1.2 tons) and France (1.1 tons) remained the main manufacturers of oxazepam in 2012, jointly accounting for almost 99 per cent of global output. Global stocks were stable during the period 2011-2012, at an annual level of 18.4 tons. The volume of trade in oxazepam has gradually declined during the past decade, from 41 tons in 2003 to 17.3 tons in 2009, before increasing to 27.5 tons in 2012. Italy (21.7 tons), Germany and India (1.9

tons each) and Hungary (1.2 tons) remained the main exporters. A total of 47 countries reported imports of oxazepam in 2012. The main importers of oxazepam, together accounting for 66 per cent of total global imports, were France (10.3 tons), Germany (2.8 tons), Canada (1.7 tons) and the Netherlands and Australia (1.5 tons each). Those countries were also the countries with the highest calculated consumption in 2012, in absolute terms. Norway (7.6 S-DDD), Finland (7.3 S-DDD), Croatia (7.1 S-DDD), France (7 S-DDD) and Austria (5.8 S-DDD) were the countries with the highest rates of calculated consumption in 2012, measured in S-DDD per 1,000 inhabitants per day.

Clobazam

78. Total reported manufacture of clobazam fluctuated between 3.3 tons in 2009 and 6.8 tons in 2011 and stood at 5.8 tons in 2012. Germany (2.9 tons) and France (2.5 tons) remained the main manufacturers, and exporters, of the substance in 2012, while data on manufacture were missing from India, which had reported an output of 2 tons for 2011. Global reported stocks had increased over the past three years, reaching 4.7 tons in 2012, mainly held in France, Germany, Canada, Brazil and the United States, in that order. International trade in clobazam was fairly stable in the past 10 years, global reported exports averaging about 5.2 tons per year during the period 2003-2012. Seventy-six countries reported imports of the substance in 2012, including France (1.1 tons), Brazil (663 kg), Japan (300 kg), Pakistan (280 kg), Canada (260 kg), Spain (212 kg) and the United States (201 kg).

Clorazepate

79. Total reported manufacture of clorazepate declined from 8.4 tons in 2003 to 4.1 tons in 2011. In 2012, global manufacture recovered slightly and stood at 4.6 tons. France and Italy were the leading manufacturers of this substance during the period 2003-2012. In 2012, those two countries accounted for almost the entire output (except for 86 grams manufactured in Canada) and for 78 per cent of global exports. International trade in clorazepate has been stable in the past two years and averaged about 5.1 tons per year during the period 2011-2012. Spain (2.4 tons), the United States (548 kg), France (302 kg, for re-export), Switzerland (274 kg) and Thailand (223 kg) were the largest importers of clorazepate in 2012, while about 40 other countries reported import and use of the substance during that year.

Other anxiolytics

80. Owing mainly to developments in Switzerland, traditionally the main manufacturer of nordazepam, total

reported manufacture of that substance varied during the period 2003-2011 between 1.3 tons in 2003 and a peak of 14.2 tons in 2006. In 2012, total global manufacture of nordazepam amounted to 2.5 tons (164 million S-DDD), with Finland (2 tons) and France (437 kg) being the largest manufacturers. Switzerland did not manufacture nordazepam in 2012. Use of nordazepam remained limited to a very few countries, namely, Finland, France, Morocco, Italy and Singapore, in descending order.

81. In 2012, global manufacture of tetrazepam stood at 21.8 tons (218 million S-DDD), manufactured mainly in France, Italy and Germany. In 2012, total reported manufacture of prazepam dropped to 1.4 tons (48 million S-DDD), as a result of no manufacture being reported by Switzerland. Total reported manufacture of ethyl loflazepate amounted to 417 kg (208 million S-DDD), Japan and France being the only manufacturers in the past decade. Since 2004, India has been the only country reporting manufacture of pinazepam; since no data on manufacture were submitted by India for 2012, global output for that year was recorded as zero. Similarly, there was no manufacture of camazepam and halazepam in 2012. The combined manufacture of clotiazepam, cloxazolam, delorazepam, fludiazepam, ketazolam, medazepam and oxazolam amounted to 511 million S-DDD in 2012.

Meprobamate

82. Meprobamate, the only non-benzodiazepine-type substance in Schedule IV used as an anxiolytic, has gradually been replaced by benzodiazepines, leading to a substantial decline in manufacture from 750 tons in the late 1970s to an annual average of 290 tons during the 1990s. During the period 2000-2009, total manufacture of meprobamate fluctuated around an annual average of 220 tons. Since then, total reported manufacture has declined continually, to 128 tons (107 million S-DDD) in 2012. China and Denmark were traditionally the main manufacturers of the substance, their combined output accounting for over 93 per cent of global manufacture in the past five years. India, which has also manufactured meprobamate in significant quantities, did not report such manufacture for 2012. The observed decline in global manufacture is primarily due to lower outputs in Denmark, which dropped from 40 tons in 2011 to 375 kg in 2012. China remained the leading manufacturer of meprobamate, reporting 127 tons of manufacture in 2012 (a 53 per cent increase over 2011). Global stocks have also continued to decrease since 2009. They stood at 47.1 tons (39.3 million S-DDD) in 2012, 93 per cent of which were held in South Africa (25 tons), France (9 tons), Hungary (4.8 tons), Denmark (2.9 tons) and the United States (2 tons).

83. International trade in meprobamate has also gradually declined, from 259 tons in 2007 to 134 tons in 2011,

before increasing to 172 tons in 2012. China (146 tons), India (13.3 tons) and Denmark (7.3 tons) were the main countries exporting meprobamate in 2012, jointly accounting for 97 per cent of global exports in that year. Other major exporters in 2012 included Switzerland (1.7 tons), France (959 kg), South Africa (910 kg) and Belgium (891 kg). A total of 34 countries reported imports of meprobamate in 2012, major importers being South Africa (114 tons), the Democratic Republic of the Congo (5.4 tons), Egypt (3 tons) and Turkey (2.4 tons). Belgium and Switzerland imported 1.8 tons and 1 ton, respectively, mainly for re-export. Global calculated consumption of meprobamate rose from 162 tons (135 million S-DDD) in 2011 to 196 tons (164 million S-DDD) in 2012, mainly due to increased consumption in South Africa. In that year, South Africa became the leading consumer of meprobamate, with 117.6 tons (98 million S-DDD), followed by Denmark (45.3 tons), Hungary (9.6 tons) and the United States (6.1 tons).

Benzodiazepine-type sedative-hypnotics

84. Twelve benzodiazepines are generally used as sedative-hypnotics: brotizolam, estazolam, flunitrazepam, flurazepam, haloxazolam, loprazolam, lormetazepam, midazolam, nimetazepam, nitrazepam, temazepam and triazolam. Comments on flunitrazepam, a substance that was transferred from Schedule IV to Schedule III in 1995, are provided in paragraphs 40-42 above.

85. During the decade leading up to 2012, total reported manufacture of the 12 substances in the group of benzodiazepine-type sedative-hypnotics was 7.2 billion S-DDD per year, on average, fluctuating between 5.5 billion S-DDD in 2008 and 9.5 billion S-DDD in 2009, owing mainly to changes in output reported by Germany, Italy, Switzerland and the United States. In 2012, global reported manufacture of benzodiazepine-type sedative-hypnotics amounted to 6.5 billion S-DDD (see figure 20), 12 per cent lower than in 2011, mainly because of a decrease in global reported manufacture of lormetazepam and triazolam. In 2012, the major manufacturers of this group of substances remained Italy (40 per cent), Germany (20 per cent), Switzerland (19 per cent), Japan (9 per cent) and China (5 per cent). Global stocks held by manufacturers were stable in the past three years, at the level of 6.4 billion S-DDD in 2012, mainly held in Germany (33 per cent), Switzerland (17 per cent), Italy (15 per cent) and the United States (12 per cent). Calculated global consumption of this group of substances was less volatile than manufacture, fluctuating around an annual average of 8 billion S-DDD during the period 2003-2012. In 2012, calculated global consumption stood at 6.6 billion S-DDD (see figure 21).

Figure 20. Benzodiazepine-type sedative-hypnotics: total reported manufacture, by substance, 2003-2012

^aThe data for 2012 are incomplete.

Figure 21. Benzodiazepine-type sedative-hypnotics: calculated global consumption,^a 2003-2012

^aStatistical data submitted by Governments are used to calculate the approximate global consumption in a given year. These consumption figures are expressed in defined daily doses for statistical purposes (S-DDD).

^bThe data for 2012 are incomplete.

86. Earlier in the decade, the calculated average annual consumption of benzodiazepine-type sedative-hypnotics, expressed in S-DDD per 1,000 inhabitants per day, was traditionally higher in Europe and in a few non-European

countries, such as Japan and Cuba, than in other regions. In recent years, however, there have been significant changes in average annual consumption rates across regions (see figure 22). While average consumption rates in Europe, the Americas and Oceania have been relatively stable in the past six years, standing at about 20, 9 and 10 S-DDD per 1,000 inhabitants per day, respectively, this indicator increased markedly in Asia, from 13.4 S-DDD to 18.7 S-DDD, mainly owing to a 29 per cent increase in the consumption rate of Japan, which stood at 63 S-DDD in 2012. It is also notable that the average annual rate of consumption of benzodiazepine-type sedative-hypnotics, although still low, almost doubled in Africa, and averaged 1.6 S-DDD per 1,000 inhabitants per day during the period 2010-2012. In 2012, South Africa and Nigeria had the highest rates of consumption in this region, with 1.8 and 1.5 S-DDD per 1,000 inhabitants per day, respectively. Calculated consumption levels of benzodiazepine-type sedative-hypnotics in individual countries, expressed in S-DDD per 1,000 inhabitants per day, are shown in part three, table IV.2, of the present publication.

87. The reported manufacture of individual substances in this group has varied greatly over the years, since manufacturers tend to produce large quantities of a substance at a time in order to keep stocks on hand for future use. There have been significant fluctuations in total manufacture of brotizolam, flunitrazepam and lormetazepam, in particular, which has affected the total level for the group as a whole. In 2012, brotizolam was the most manufactured substance in the group of benzodiazepine-type

sedative-hypnotics, accounting for 1.8 billion S-DDD, or 28 per cent, of global manufacture of this group of substances (see figure 23). Flunitrazepam was second, with an output of 1.5 billion S-DDD, or 24 per cent of global manufacture in 2012. Nitrazepam was third (716 million S-DDD, or 11.1 per cent), followed by temazepam (702 million S-DDD, or 10.9 per cent), lormetazepam (608 million S-DDD, or 9.4 per cent), estazolam (398 million S-DDD, or 5.9 per cent), midazolam (398 million S-DDD, or 5.9 per cent), triazolam (237 million S-DDD, or 3.6 per cent), and others (237 million S-DDD, or 3.6 per cent).

Figure 23. Benzodiazepine-type sedative-hypnotics: share of total reported manufacture, by substance, 2012

Figure 22. Benzodiazepine-type sedative-hypnotics: average national consumption,^a by region, 2004-2012

^aStatistical data submitted by Governments are used to calculate the average annual consumption for a three-year period.

Figure 24. Benzodiazepine-type sedative-hypnotics: reported total manufacture, selected countries, 2003-2012

^aThe data for 2012 are incomplete.

million S-DDD, or 6.2 per cent), midazolam (231 million S-DDD, or 3.6 per cent) and triazolam (218 million S-DDD, or 3.4 per cent). The remaining substances in this group together accounted for about 4 per cent of total manufacture in 2012: flurazepam (141 million S-DDD, or 2.2 per cent), loprazolam (124 million S-DDD, or 1.9 per cent) and nimetazepam (16 million S-DDD); no manufacture of haloxazolam was reported.

88. The main countries reporting manufacture of benzodiazepine-type sedative-hypnotics during the decade up to 2012 are shown in figure 24. Throughout that period, Italy was the leading manufacturer, accounting in 2003 for more than half of global manufacture of such substances. In 2012, Italy manufactured benzodiazepine-type sedative-hypnotics amounting to 2.6 billion S-DDD, which, although 30 per cent lower than in 2011, still accounted for 40 per cent of global manufacture of such substances (see figure 25).

Figure 25. Benzodiazepine-type sedative-hypnotics: total reported manufacture, selected countries, 2012

Brotizolam

89. Brotizolam is a potent hypnotic. Together with triazolam, it has the lowest S-DDD of all psychotropic substances (0.25 mg). Germany was the first country to report manufacture of brotizolam, in 1997. Since that year, the substance has usually been manufactured by Germany in amounts of several hundred kilograms per year and, to a much lesser extent, by Italy and Japan. Global reported manufacture of brotizolam has increased by 20 per cent,

from 372 kg in 2011 to 446 kg in 2012. Germany (320 kg) and Japan (91 kg) remained the main manufacturers of the substance. Global stocks stood at 383 kg (1.5 billion S-DDD) in 2012, 79 per cent of which were held in Germany. Germany also remained the main exporter of brotizolam in 2012, accounting for 162 kg, or 80 per cent of total exports of the substance. Nine countries reported having imported more than 1 kg of brotizolam in 2012, Japan being the biggest importer (144 kg) and accounting for 71 per cent of total imports. Global calculated consumption of brotizolam stood at about 1.4 billion S-DDD in 2012, mainly in Japan (69 per cent) and Germany (23 per cent).

Nitrazepam

90. Italy, China and India, in descending order, were the main manufacturers of nitrazepam in the past decade. In the period 2003-2010, global reported manufacture of this substance ranged between 4 and 6.8 tons per year, with an annual average of 5.2 tons. In 2011, total manufacture of nitrazepam fell to 2.9 tons, owing to sharp decreases in the reported outputs of Italy and India. In 2012, global manufacture increased to 3.6 tons (716 million S-DDD), of which Italy accounted for 71 per cent. In the absence of data reported by India, which had been a major manufacturer of nitrazepam during the period 2003-2010, the only other countries reporting manufacture of nitrazepam in 2012 were China (850 kg), Canada (92 kg), Germany (50 kg), the Russian Federation (38 kg) and New Zealand (6 kg). Following the trend in manufacture, the global stocks of nitrazepam have been gradually decreasing in recent years, from 4.6 tons in 2009 to 1.4 tons in 2012. Exports of nitrazepam, which had averaged about 4.2 tons annually during the preceding nine years (2003-2011), increased from 3.2 tons in 2011 to 5.1 tons in 2012. Italy (3.6 tons), China (850 kg) and India (358 kg) continued to be the main exporters of the substance, together accounting for 94 per cent of all nitrazepam exports in 2012. Forty countries have imported nitrazepam in quantities exceeding 1 kg in the past five years (2008-2012). Japan (51 per cent), the United Kingdom (8 per cent), Nigeria (5 per cent), Germany (4.7 per cent) and Canada (4 per cent) were the main importers of nitrazepam in 2012. Global calculated consumption of nitrazepam, which amounted on average to almost 6 tons (1.2 billion S-DDD) annually during the period 2008-2010, has decreased significantly (by 44 per cent) in the past two years, with an average of 3.4 tons (684 million S-DDD) of the substance consumed annually during the period 2011-2012. Measured in S-DDD per 1,000 inhabitants per day, Japan (8.8 S-DDD), Bosnia and Herzegovina (4.4 S-DDD), Croatia (3.3 S-DDD), Australia (3.1 S-DDD) and Canada (3 S-DDD) had the highest rates of calculated consumption in 2012.

Temazepam

91. During the period 2003-2012, Italy was the leading manufacturer and exporter of temazepam and Canada, India, Poland, the United Kingdom and the United States reported intermittent manufacture of the substance for some of those years. In the past three years, global reported manufacture of temazepam gradually decreased from 21.6 tons in 2010 to 14 tons in 2012, with Italy accounting for about 93 per cent (13 tons) of the total. The only other manufacturers of the substance in 2012 were Canada (987 kg), the United States (23 kg) and Germany (6 grams). Global stocks of temazepam held by manufacturers stood at 10.4 tons in 2012 (a 28 per cent decrease compared with 2011), held mainly in Italy, the United States, the United Kingdom, Canada and Hungary, in descending order. Global exports of temazepam were stable in the past three years, averaging 19 tons per year during the period 2010-2012. Nineteen countries imported temazepam in quantities exceeding 1 kg in 2012, with the United States remaining the largest importer (10.9 tons) and consumer of the substance. The other major importers of temazepam in 2012 were Finland (1.2 tons), the Netherlands and Australia (about 1.1 tons each), and Canada and the United Kingdom (with about 1 ton each). Global calculated consumption of temazepam stood at 17.9 tons (897 million S-DDD) in 2012. The United States accounted for 51 per cent of the total, while Canada, Italy, Australia and the Netherlands, in that order, together accounted for 39 per cent. According to reported statistics, measured in S-DDD per 1,000 inhabitants per day, Finland (17.4 S-DDD), Canada (10.2 S-DDD) and the Netherlands (8.5 S-DDD) had the highest calculated rates of consumption in 2012.

Lormetazepam

92. In the period 2003-2011, total reported manufacture of lormetazepam was consistently above 1 ton, except in 2003 (380 kg) and in 2007 (809 kg). The fluctuations were the result of developments in Germany and Italy, the two main manufacturers and exporters of the substance. In 2012, global output of lormetazepam fell again, to 608 kg (608 million S-DDD), reflecting the output of Italy, which was the only country reporting manufacture of the substance that year. Global stocks held by manufacturers decreased to 1.3 tons (1.3 billion S-DDD) in 2012, mainly held in Germany (65 per cent), Italy (13 per cent) and Finland (10 per cent). The volume of reported international trade decreased from 1.9 tons in 2011 to 1.5 tons in 2012. Italy (582 kg), Germany (382 kg), Finland (197 kg) and Spain (158 kg) jointly accounted for 90 per cent of global exports in 2012. Twenty countries reported imports of lormetazepam in 2012, the main importers being Spain (456 kg), Finland (220 kg) and Belgium (195 kg). As in the past, some of those countries imported the substance

mainly for re-export. The calculated global consumption, which had fluctuated in the past decade between 790 kg in 2003 and 2 tons in 2010, stood at 1.2 tons (1.2 billion S-DDD) in 2012. Rates of consumption continued to be particularly high in Europe, with the highest calculated rates of consumption, expressed in S-DDD per 1,000 inhabitants per day, recorded for Belgium (48), Spain (18), Italy (17) and Finland (10).

Estazolam

93. After staying fairly stable during the period 2008-2010 at an average annual level of 2.5 tons, global reported manufacture of estazolam gradually decreased in the following two years, to less than 1.2 tons (398 million S-DDD) in 2012, as a result of lower outputs reported by China, which was the major manufacturer of the substance during the period 2003-2011. In 2012, China reported manufacture of 501 kg of estazolam, which represents a 37 per cent reduction on the year before. Other countries reporting manufacture of estazolam in 2012 were, in descending order, Japan, Poland, Italy, the United States and Israel. The reported total stocks of the substance increased by more than five-fold in 2012 and amounted to 702 kg (234 million S-DDD), 81 per cent of which were held in China. Use of the substance outside the manufacturing countries has increased steadily since the 1980s, with international trade in 2011 reaching the highest level ever reported (405 kg). In 2012, global exports decreased slightly, to 384 kg. The leading exporters of estazolam have traditionally been Japan and Italy; in 2012, those two countries accounted for 63 and 29 per cent of global exports, respectively. About 15 countries reported imports of estazolam in quantities exceeding 1 kg during the period 2008-2012. In 2012, Italy (57 kg), the Netherlands (36 kg), Japan and Portugal (30 kg each), France (27 kg) and the United States (18 kg) jointly accounted for 87 per cent of total imports of the substance. Global calculated consumption of estazolam has continued its downward trend in the past three years, decreasing from over 2.5 tons (848 million S-DDD) in 2009 to 533 kg (178 million S-DDD) in 2012. Measured in S-DDD per 1,000 inhabitants per day, in 2012 Portugal (2.6 S-DDD), Japan (2.4 S-DDD) and Poland (1.4 S-DDD) had the highest rates of calculated consumption.

Midazolam

94. Global reported manufacture of midazolam, which had fluctuated significantly in the past decade within the range of 2.7 tons (2006) and 8.7 tons (2005) per year, dropped from 7.2 tons in 2011 to 4.6 tons in 2012. Brazil, India, Israel, Italy and Switzerland have been the main manufacturers of the substance. However, data on manufacture of midazolam for 2012 have not been received from

India and Switzerland did not manufacture the substance in 2012, which accounts for the drop in output. Israel was the largest manufacturer of midazolam in 2012, with 1.9 tons, followed by Brazil (1.4 tons), Italy (1 ton) and China (305 kg). In addition, Canada, Costa Rica, Ecuador and the United States reported manufacture of midazolam in 2012, their outputs ranging from 1 to 8 kg. In 2012, global reported exports of the substance stood at 7.6 tons, which represents a 20 per cent increase on the year before. As in previous years, Switzerland (3.1 tons), Israel (1.8 tons), India (654 kg), Italy (639 kg) and Germany (576 kg) continued to be the main exporters of midazolam, jointly accounting for 89 per cent of the global total. Midazolam is used in many countries; over 80 countries reported imports of midazolam in quantities above 1 kg in the period 2008-2012. The main importer in 2012 was Switzerland (1.2 tons, entirely for re-export), followed by the United States and Germany (949 kg each), France (496 kg) and Brazil (486 kg). Together, those countries accounted for 62 per cent of global imports of midazolam. Calculated global consumption of midazolam stood at 5.7 tons (285 million S-DDD) in 2012. Switzerland (2.7 S-DDD), Sint Maarten (2.6 S-DDD), Costa Rica (2.4 S-DDD), Curaçao (2.3 S-DDD), Portugal (1.8 S-DDD), Uruguay (1.6 S-DDD) and Hungary (1.5 S-DDD) were the countries with the highest rates of calculated consumption of midazolam for 2012, measured in S-DDD per 1,000 inhabitants per day.

Triazolam

95. Global reported manufacture of triazolam fluctuated significantly during the period 2008-2012, mainly reflecting the manufactured quantities reported by the United States, which had been the leading manufacturer of triazolam throughout the past decade. In 2012, the United States did not report manufacture of triazolam and, as a result, the global total dropped by 80 per cent, to 55 kg (218 million S-DDD), compared with 2011 (267 kg, or over 1 billion S-DDD). The only countries reporting manufacture of triazolam in 2012 were Italy (48 kg), Japan (6.5 kg) and Canada (6 grams). Total exports of triazolam in 2012 amounted to 288 kg. The United States (141 kg) continued to be the main exporter, followed by Italy (85 kg), Belgium (22 kg), Switzerland (15 kg), France (12 kg) and India (11 kg). More than 40 countries reported imports of triazolam in the period 2008-2012. Throughout the decade leading up to 2012, Japan was the largest importer of triazolam, accounting in 2012 for almost 60 per cent of global imports. Total calculated consumption of triazolam stood at 821 million S-DDD in 2012, with Japan (651 million S-DDD), Italy (96 million S-DDD) and Austria (27 million S-DDD) being the main consumers in absolute terms. In 2012, measured in S-DDD per 1,000 inhabitants per day, Japan (14 S-DDD), Austria (9 S-DDD) and Italy (4.4 S-DDD) had the highest calculated consumption rates of triazolam.

Flurazepam

96. Global reported manufacture of flurazepam stood at 4.2 tons in 2012, which is 21 per cent higher than in 2011. Italy continued to be the largest manufacturer, accounting for 80 per cent of total output, followed by Brazil and Canada. No other countries reported manufacture of the substance in 2012. Italy (2.8 tons) also remained the largest exporter of flurazepam in 2012, accounting for 73 per cent of global exports (3.8 tons). The main importers of flurazepam continued to be Spain (1.1 tons), Canada (378 kg), Germany (355 kg) and the United States (318 kg), which together accounted for 63 per cent of total imports of the substance in 2012. Rates of consumption continued to be higher in Europe, with the highest calculated rates of consumption in 2012, expressed in S-DDD per 1,000 inhabitants per day, recorded for Ireland (2.8 S-DDD), Belgium and Italy (1.7 S-DDD each) and Spain and Switzerland (1.2 S-DDD each).

Loprazolam

97. Total reported manufacture of loprazolam in 2012 amounted to 124 kg, all reported by France, which has traditionally been the main manufacturer and leading exporter of the substance and also held 92 per cent of global stocks (68 kg). In the past decade small quantities were occasionally manufactured by India, the United Kingdom and the United States. Global reported exports of loprazolam increased by 10 per cent over 2011 and stood at 189 kg in 2012. About 25 countries used loprazolam in the period 2008-2012, the main importing countries in 2012 being France (49 kg), Poland (43 kg), South Africa (17 kg) and Spain (15 kg).

Other benzodiazepine-type sedative-hypnotics

98. The remaining substances in this group, nimetazepam and haloxazolam, are manufactured and used almost solely in Japan. In 2012, that country reported manufacture of 80 kg of nimetazepam; no manufacture of or international trade in haloxazolam was reported.

Benzodiazepine-type anti-epileptics

Clonazepam

99. Clonazepam is a benzodiazepine that is used mainly as an anti-epileptic. In the past decade, global reported manufacture of clonazepam gradually increased, from 3.9 tons in 2003 to a record of 12 tons in 2011. In 2012, total output stood at 10.2 tons (1.3 billion S-DDD), owing to

the fact that data from India, which had reported output of over 3 tons for 2011, had not been received. Switzerland was the leading manufacturer of clonazepam in the world during the two decades leading up to 2010. In 2011, Italy became the largest manufacturer of the substance and, in 2012, its share of global output reached 43 per cent (4.4 tons). The other major manufacturers of clonazepam in 2012 were Switzerland (2.7 tons), Brazil (1.8 tons), China (720 kg) and Poland (284 kg) (see figure 26).

100. Total reported stocks of clonazepam almost doubled, increasing from 10.6 tons in 2011 to 20.5 tons in 2012, 76 per cent of which were held in Canada (10.8 tons) and Switzerland (4.9 tons). Global exports of clonazepam also followed an upward trend until 2011. After a record of 12.9 tons exported in 2011 however, total exports decreased to 11.7 tons in 2012. Switzerland, India and Italy remained the main exporters of clonazepam in 2012, together accounting for almost 80 per cent of the global total. More than 100 countries reported imports of clonazepam in 2012. Of those, eight countries imported more than 400 kg of the substance, both for domestic use and for re-export, namely, the United States (2.2 tons), Switzerland (1.2 tons), Brazil (904 kg), Spain (902 kg), Israel (901 kg), Argentina (838 kg), Canada (645 kg) and the Islamic Republic of Iran (475 kg). Use of clonazepam expanded from about 50 countries in 1995 to more than 140 countries in the period 2008-2012. Global calculated consumption of the substance remained stable in the past five years and averaged 1.2 billion S-DDD annually in the period 2008-2012. In

2012, global calculated consumption stood at 1.3 billion S-DDD. The seven countries with the highest levels of calculated consumption of clonazepam were the United States (321 million S-DDD), Brazil (281 million S-DDD), Italy (137 million S-DDD), Argentina (97 million S-DDD), China (65 million S-DDD), the Islamic Republic of Iran (59 million S-DDD) and Israel (42 million S-DDD). The rates of calculated consumption of clonazepam, measured in S-DDD per 1,000 inhabitants per day, in individual countries are shown in part three, table IV.4, of the present publication.

Barbiturate-type sedative-hypnotics and anti-epileptics listed in Schedule IV

Allobarbitol, barbital, butobarbital, methylphenobarbital, phenobarbital, secbutabarbital and vinylbital

101. The seven barbiturates in Schedule IV are pharmacologically related to those in Schedule III. Five of the seven substances, namely allobarbitol, barbital, butobarbital, secbutabarbital and vinylbital, are intermediate-acting barbiturates and are mainly used as hypnotics (to induce sleep). They are no longer used as daytime sedatives. The other two substances, methylphenobarbital and phenobarbital, have additional properties and are also used as anti-epileptics (long-acting barbiturates). Phenobarbital continued to be the most commonly used substance in this group in 2012, followed by barbital. More information on calculated consumption of phenobarbital is shown in part three, table IV, of the present publication.

102. Total reported manufacture of the seven barbiturates in Schedule IV (for both direct medical use and the manufacture of non-psychotropic substances) rose from 4 billion S-DDD in the period 1999-2000 to an average of 5.1 billion S-DDD in 2006. After that year, reported global manufacture started to decline, with fluctuations, to a total of 3.3 billion S-DDD in 2012. Changes in the quantities of phenobarbital manufactured, which continued to be the most widely manufactured substance in this group, accounted for the changes in output. In 2012, the share of phenobarbital in total manufacture (expressed in S-DDD) was 98.6 per cent. Barbital, butobarbital and secbutabarbital together accounted for the remainder. No manufacture of allobarbitol or methylphenobarbital was recorded in 2012 and no manufacture of vinylbital has been reported since 1996.

103. In 2012, the countries with the highest calculated consumption rates of barbiturate-type sedative-hypnotics in Schedule IV were, in descending order, Italy, Georgia,

Figure 26. Clonazepam: total reported manufacture, selected countries, 2003-2012

^aThe data for 2012 are incomplete.

Thailand, Israel, France, Turkey, Lebanon, Albania, Denmark, Hungary and Lithuania, with consumption rates ranging between 0.13 and 0.03 S-DDD per 1,000 inhabitants per day. As for the barbiturate-type anti-epileptics listed in Schedule IV, the countries with the highest calculated consumption levels, in S-DDD per 1,000 inhabitants per day, were, in descending order, Bulgaria, Ukraine and Brazil. More information on calculated consumption is shown in part three, table IV, of the present publication.

104. Global manufacture of phenobarbital, which had fluctuated between 360 and 480 tons during the period 2003-2011, fell to 329 tons (3.3 billion S-DDD) in 2012. That decrease can be attributed to the decrease in manufacture in China and the Russian Federation, the leading manufacturers of that substance. Total manufacture decreased in China from 262 tons in 2011 to 201 tons in 2012 and in the Russian Federation from 53.7 tons in 2011 to 32 tons in 2012, while Hungary and Japan manufactured 84 tons and 9 tons, respectively, in 2012. India, which had manufactured 26 tons in 2011, did not report manufacture in 2012. For details on reported manufacture in selected countries, see figure 27. Global stocks of phenobarbital stayed at about the same level as in 2011 (163 tons), with around 78 per cent of them being held in China, Brazil, Switzerland, Hungary, France, the Philippines and Ukraine, in descending order. In terms of calculated consumption, major users of phenobarbital in 2012 included China, Brazil, the Russian Federation, Japan, the United States and Ukraine, in that order.

^aThe data for 2011 are incomplete.

105. Phenobarbital continues to be one of the most widely traded psychotropic substances, with an average of 140 countries trading the substance every year. Compared with 2011, the total volume of international trade in phenobarbital decreased to 242 tons in 2012. Hungary, India, China, Switzerland, the United States and Germany, in that order, together accounted for 91 per cent of total exports. More than 120 countries reported imports of phenobarbital in 2012. Major importers of the substance included the Russian Federation (18 per cent of total imports), Brazil (11 per cent), Switzerland (10 per cent), the United States (8 per cent), Ukraine (8 per cent), Germany (6 per cent), France (5 per cent) and Japan (4 per cent).

106. Global manufacture of barbital fell from 122 tons (245 million S-DDD) in 2011 to 23 tons (47 million S-DDD) in 2012, the lowest amount recorded since 1980. This decrease reflects a major decrease in manufacture by China, the leading manufacturer of barbital, which reported manufacture of only 21 tons in 2012 compared with 120 tons in 2011. Japan was the other major manufacturer; output in that country in recent years has remained at about 2 tons each year. The barbital manufactured in Japan was mainly for domestic consumption, including for use in the manufacture of non-psychotropic substances. Parallel to the decreased global manufacture, total calculated consumption of barbital decreased from 122 tons in 2011 to just 7 tons in 2012. China reported consumption of 58 tons of barbital in 2012. In terms of total calculated consumption, China, Italy, the United States and Thailand, in that order, continued to be the major users of the substance.

107. At almost 17 tons in 2012, the volume of international trade in barbital remained more or less at the same level as in 2011. China, the leading exporter of barbital, exported 8.3 tons in 2012 and Germany imported 8.3 tons and re-exported 7.2 tons during that year. A combined total of 4.1 tons was imported by Italy, the United States and Thailand. The United States used some of the amounts imported to manufacture preparations exempted from certain control measures in accordance with article 3 of the 1971 Convention. Japan, which had imported 4 tons in 2011, imported only 16 kg in 2012.

108. Manufacture of methylphenobarbital fluctuated considerably during the period 2003-2011, ranging between 10 kg and 22 tons, owing to significant changes in the output reported by the manufacturing countries, namely India, Switzerland and the United States. No manufacture of methylphenobarbital was reported in 2012. Global stocks of methylphenobarbital dropped from 5.6 tons in 2011 to 4.9 tons in 2012, with 94 per cent held in Switzerland. Based on total calculated consumption, Croatia, Switzerland and Italy, in that order, were the main users of the substance in 2012.

109. With 2.1 tons in 2012, the volume of international trade in methylphenobarbital remained at around the same level as in 2011 (1.8 tons). Croatia and Germany imported 900 kg of the substance each, together accounting for 86 per cent of total imports in 2012. Germany, which re-exported 900 kg during that year, India (500 kg) and Switzerland (250 kg) were the main exporters during 2012.

110. During the past 10 years, allobarbital has been manufactured intermittently by Germany and Belgium, in amounts of several tons per year. Since 2010, no manufacture of allobarbital has been reported. Global stocks of the substance continued to decrease steadily, from 1.3 tons in 2009 to 740 kg in 2012. Of these stocks, 59 per cent was held in Germany and the remainder, in descending order, in Ireland, Switzerland, Turkey and Israel. With only Switzerland reporting an export, of 200 kg of allobarbital to Turkey during 2012, global trade in that substance fell to 200 kg, just half of its volume in 2011.

111. Secbutabarbital has been manufactured intermittently during the past decade. After Germany stopped manufacturing the substance in 2003, the United States became the sole manufacturer. In 2012, the United States manufactured 94 kg of secbutabarbital. Global stocks of the substance went up from 56 kg in 2011 to 139 kg in 2012. Half of them were held in the United States, 34 per cent in Lebanon and 11 per cent in Germany. The United States and Lebanon were the main users in 2012. Lebanon was the only country that reported importing the substance (25 kg) in 2012.

112. No manufacture of butobarbital was reported between 2000 and 2011, with the exception of Germany reporting manufacture of 117 kg in 2008. In 2012, however, the United States manufactured 94 kg of that substance and consumed 25 kg of that amount. The other main consumer in 2012 remained Jordan, reporting total imports of 6 kg during that year. Global stocks of butobarbital increased to 106 kg in 2012, with 76 kg held by the United States and 26 kg by Germany.

Barbiturates in Schedules II, III and IV

113. Of the 12 barbiturates listed in Schedules II, III and IV of the 1971 Convention, five substances, phenobarbital, pentobarbital, butalbital, barbital and amobarbital, in that order, together accounted, on average, for 99 per cent of total reported manufacture of those barbiturates during the period 2008-2012. The shares of total manufacture of the 12 substances in 2012 are shown in figure 28. Phenobarbital remained the most widely manufactured barbiturate in 2012, accounting for 79 per cent of the total manufacture of the 12 barbiturates, followed by pentobarbital (12 per cent) and butalbital (7 per cent). China continued to be the leading manufacturer, accounting for 50 per cent of

total manufacture of the entire group of barbiturates, followed by Hungary (20 per cent), the United States (9 per cent), Denmark (6 per cent), Germany (5 per cent) and Japan (2 per cent) (see figure 29).

Figure 28. Barbiturates in Schedules II, III and IV: share of total reported manufacture, by substance, 2012

Figure 29. Barbiturates in Schedules II, III and IV: total reported manufacture, selected countries, 2012

Other sedative-hypnotics listed in Schedule IV

114. Four substances from the group of sedative-hypnotics in Schedule IV are neither barbiturates nor benzodiazepines: ethchlorvynol, ethinamate, methyprylon and

zolpidem. Following a decision of the Commission on Narcotic Drugs in March 2013, GHB, which was initially added to Schedule IV in 2001, was rescheduled and moved to Schedule II of the 1971 Convention.

115. Zolpidem, which was brought under international control in 2001, is used mainly for the treatment of insomnia. During the period 2003-2012, global manufacture of the substance fluctuated widely, between 24 and 50 tons, around a 10-year average of 34 tons. Those fluctuations have reflected the changing outputs of the main manufacturing countries, France, India and Israel, which accounted for 83 per cent of global manufacture in the past five years. In the past two years, total reported manufacture of zolpidem was stable, with global output amounting to 32.3 tons (3.2 billion S-DDD) in 2012. France accounted for 12.6 tons and Israel for 12.3 tons; India, which manufactured 13.2 tons in 2011, did not report concerning

manufacture of zolpidem in 2012. Other countries, including the Czech Republic, Japan, Argentina, Canada, Italy and Brazil, in descending order, also manufactured significant quantities of zolpidem in 2012. Total stocks of zolpidem have increased steadily during the past five years and attained 29.1 tons (2.9 billion S-DDD) in 2012, 75 per cent of which were held in Israel, France and the United States, in descending order.

116. Zolpidem is one of the most widely traded and used psychotropic substances. Global reported exports amounted to 52 tons in 2012, with 34 countries reporting exports of the substance to about 100 countries. India (16.6 tons), France (9.9 tons), the Czech Republic (7.4 tons) and Israel (5.3 tons) were the main exporters in 2012, accounting for 76 per cent of global exports. The United States, France, Japan, Uruguay and the Czech Republic, in that order, had the highest levels of calculated consumption in 2012.

Part three

Troisième partie

Tercera parte

Table IV. Levels of consumption of groups of psychotropic substances in defined daily doses for statistical purposes (S-DDD) per thousand inhabitants per day

The 1971 Convention does not foresee the reporting of consumption of psychotropic substances to the Board. Levels of consumption of groups of psychotropic substances in defined daily doses for statistical purposes (S-DDD) per thousand inhabitants per day have therefore been calculated on the basis of statistics on manufacture and trade provided by Governments. To exclude the impact of yearly fluctuations on the calculated annual consumption, the average for the three-year period 2010-2012 was calculated. In countries that do not manufacture and export psychotropic substances, quantities declared as imported are considered to be destined for consumption. For countries with manufacture and exports of psychotropic substances, the average annual manufacture is added to the average annual import; the average annual export and amounts of psychotropic substances used for conversion into other psychotropic or non-psychotropic substances are deducted. Countries and territories are presented in order of descending levels of consumption expressed in numbers of defined daily doses consumed on average per day and per thousand inhabitants. The names of territories appear in italics.

Conclusions on the actual level of consumption of psychotropic substances should be drawn with caution as data on manufacture and trade reported by Governments may not be complete or may not

cover all substances. High levels of consumption may, however, indicate over-prescription and/or diversion into illicit channels. The Governments concerned should review the data. The groups of psychotropic substances are presented in table III.2.

Pursuant to Commission on Narcotic Drugs resolution 54/6, which encourages Member States to report to the International Narcotics Control Board data on the consumption of psychotropic substances, Governments have started to submit such data for the years 2011 and 2012. The amount of data received cannot yet lead to a comprehensive comparison of consumption levels of psychotropic substances between countries or years. The Board therefore decided to continue to publish, in this edition of the technical publication on psychotropic substances, the calculated consumption levels of psychotropic substances based on the statistics submitted by Governments in form P. Nevertheless, since the data on consumption received from Governments are sometimes quite different from the calculated consumption data, and since the reported consumption levels are considered more accurate than the consumption levels calculated by the Board, the Board has shown the levels of reported consumption of psychotropic substances, when such data have been received, together with the levels of calculated consumption.

^a In the past, the Board calculated one S-DDD to be equal to 1.2 mg of buprenorphine, a measure that reflected the dosage units used for treatment of pain in the late 1990s. In view of the increasing use of higher dosage units of buprenorphine for the treatment of pain and opioid dependence, the Board decided to calculate, as of 2010, one S-DDD to be equal to 8 mg of buprenorphine. Data on buprenorphine expressed in S-DDD in this publication are therefore not comparable with the corresponding data shown for previous years. — Par le passé, l'OICS se fondait, pour la buprénorphine, sur une S-DDD de 1,2 mg, ce qui correspondait à la dose utilisée pour le traitement de la douleur à la fin des années 1990. Considérant l'emploi de plus en plus fréquent de doses supérieures pour le traitement de la douleur et de la dépendance aux opioïdes, l'OICS a décidé de se fonder, à compter de 2010, sur une S-DDD de 8 mg. Les données relatives à la buprénorphine qui sont exprimées en S-DDD dans la présente publication ne sont donc pas comparables avec les données correspondantes qui figurent dans les publications des années précédentes. — Anteriormente la Junta calculaba que una S-DDD equivalía a 1,2 miligramos de buprenorfina, cantidad que reflejaba las unidades de dosificación utilizadas para el tratamiento del dolor a finales del decenio de 1990. Debido al uso cada vez más generalizado de unidades de dosificación de buprenorfina más altas para el tratamiento del dolor y la dependencia a los opioides, la Junta decidió calcular, a partir de 2010, que una S-DDD equivale a 8 miligramos de buprenorfina. Por tanto, los datos sobre la buprenorfina expresados en S-DDD en la presente publicación no son comparables a los datos correspondientes a años anteriores.

^b The consumption could have been reported for 2010, for 2011, for 2012 or for all three years. — Des données sur la consommation ont pu être communiquées pour 2010, pour 2011, pour 2012 ou pour ces trois années. — El consumo pudo haberse comunicado respecto de 2010, de 2011, de 2012 o por los tres años.

Table V. Assessments of annual medical and scientific requirements for substances listed in Schedules II, III and IV of the Convention on Psychotropic Substances of 1971

Assessments of annual medical and scientific requirements for substances listed in Schedules II, III and IV of the Convention on Psychotropic Substances of 1971 are published in accordance with the provisions of Economic and Social Council resolutions 1981/7 of 6 May 1981 and 1991/44 of 21 June 1991. The Council requested Governments to assess, from time to time, their annual requirements and to submit the assessments to INCB for publication.

The reported medical and scientific requirements are intended to supplement the import and export control system for international trade established in article 12 of the 1971 Convention. The reported assessments are intended to assist the national authorities of exporting countries in ascertaining whether a requested import appears to be excessive in comparison with a reported annual requirement for that country. If that is the case, the export should be denied until the designated national authorities of the importing country confirm the legitimacy of the import request and authenticate the import documents. It is expected that scrupulous adherence to this procedure will substantially diminish attempts at diversion, especially those involving very large quantities.

The countries and territories that have submitted assessments for psychotropic substances are presented in English alphabetical order. The names of territories appear in italics. The names of countries and territories are those that were in official use at the time the data were collected (in 2012).

Pursuant to Economic and Social Council resolution 1996/30 of 24 June 1996, INCB established assessments of annual licit requirements of psychotropic substances for countries that have not yet submitted such information. In the table below, assessments established by INCB are indicated by footnote ^(a).

The assessments established by INCB reflect previous patterns of use of psychotropic substances in the respective countries. They should not be considered as recommended consumption levels. The only objective of these assessments is to provide exporting countries with approximate information on legitimate requirements of the importing country. The Board encourages all Governments concerned to establish their own assessments as soon as possible.

Exporting countries should note that importing countries are free to replace any substance for which an assessment has been established by INCB with another substance from the same therapeutic group and the same schedule, provided that the quantity to be imported, expressed in defined daily doses for statistical purposes (S-DDDs), does not exceed the equivalent of the assessment also expressed in S-DDDs. The composition of the respective therapeutic groups and the S-DDDs of the substances in those groups are indicated in table III.2 of the present publication.

Tableau V. Prédiction des besoins annuels médicaux et scientifiques concernant les substances énumérées aux Tableaux II, III et IV de la Convention de 1971 sur les substances psychotropes

Les prévisions des besoins annuels médicaux et scientifiques concernant les substances énumérées aux Tableaux II, III et IV de la Convention de 1971 sur les substances psychotropes sont communiquées conformément aux dispositions des résolutions 1981/7, en date du 6 mai 1981, et 1991/44, en date du 21 juin 1991, du Conseil économique et social. Le Conseil a prié les gouvernements d'effectuer de temps à autre des prévisions de leurs besoins annuels et de communiquer ces prévisions à l'Organe international de contrôle des stupéfiants afin qu'elles soient publiées.

Les indications relatives aux besoins médicaux et scientifiques sont destinées à compléter le système de contrôle du commerce international à l'importation et à l'exportation prévu à l'article 12 de la Convention de 1971. Les prévisions doivent permettre d'aider les autorités des pays exportateurs à déterminer si une importation demandée par un pays semble excessive par rapport aux besoins annuels signalés par ce pays. Dans ce cas, il ne faudra pas que l'exportation ait lieu tant que les services officiels du pays importateur n'auront pas confirmé la validité de la demande d'importation et authentifié les documents d'importation. On pense qu'en se conformant scrupuleusement à cette procédure on parviendra à éliminer les tentatives de détournement, notamment celles qui impliquent de très grandes quantités des substances visées.

Les pays et territoires qui ont soumis des prévisions pour des substances psychotropes sont présentés dans l'ordre alphabétique anglais. Les noms des territoires sont en italique. Les noms des pays

et territoires sont ceux qui étaient officiellement en usage au moment où les données ont été recueillies (en 2012).

En application de la résolution 1996/30, en date du 24 juin 1996, du Conseil économique et social, l'OICS a évalué les besoins annuels en substances psychotropes utilisées à des fins licites pour les pays qui ne les ont pas encore communiqués. Dans le tableau ci-après, les évaluations ainsi établies par l'OICS comportent un renvoi à une note de bas de page indiquée par une lettre (a).

L'OICS a évalué les besoins en substances psychotropes des différents pays en se fondant sur les profils d'utilisation propres à ces pays. Les prévisions indiquées ne sont pas des niveaux de consommation recommandés. Elles ont été établies dans le seul but de fournir aux pays exportateurs des renseignements approximatifs sur les besoins légitimes des pays importateurs. L'OICS encourage tous les gouvernements visés à établir leurs propres prévisions aussitôt que possible.

Les pays exportateurs doivent noter que les pays importateurs sont libres de remplacer toute substance, pour laquelle l'OICS a évalué les besoins, par une autre substance appartenant au même groupe thérapeutique et inscrite au même tableau, à condition que la quantité à importer, exprimée en doses quotidiennes déterminées à des fins statistiques S-DDD, ne dépasse pas l'équivalent de la prévision (également exprimé en S-DDD). La composition des différents groupes thérapeutiques et la valeur des S-DDD des substances appartenant à ces groupes sont indiquées au tableau III.2 de la présente publication.

Cuadro V. Previsiones de las necesidades anuales para fines médicos y científicos de las sustancias incluidas en las Listas II, III y IV del Convenio de 1971 sobre sustancias sicotrópicas

Las previsiones de las necesidades anuales para fines médicos y científicos de las sustancias incluidas en las Listas II, III y IV del Convenio sobre sustancias sicotrópicas de 1971 se publican de conformidad con las disposiciones de las resoluciones del Consejo Económico y Social 1981/7, de 6 de mayo de 1981, y 1991/44, de 21 de junio de 1991. El Consejo pidió a los gobiernos que evaluaran periódicamente sus necesidades anuales y que presentaran las previsiones a la JIFE con miras a publicarlas.

Los informes sobre las necesidades para fines médicos y científicos complementan el sistema de control de importaciones y exportaciones, en el comercio internacional, establecido en el artículo 12 del Convenio de 1971. Las previsiones presentadas tienen por objeto ayudar a las autoridades nacionales de los países exportadores a determinar si la importación solicitada parece excesiva en comparación con las necesidades anuales declaradas por el país en cuestión. En esos casos, debe negarse la exportación hasta que las autoridades competentes del país importador confirmen la legitimidad de la petición de importación y autentiquen los documentos de importación. Cabe esperar, que si se sigue escrupulosamente este procedimiento disminuyan considerablemente los intentos de desviación, especialmente los que entrañan grandes cantidades de sustancias.

Los países y territorios que han suministrado previsiones para las sustancias sicotrópicas se presentan en orden alfabético inglés. Los nombres de los territorios figuran en letra cursiva. Los

nombres de los países y territorios son los que utilizaban oficialmente en el momento en que se obtuvo la información (en 2012).

De conformidad con la resolución 1996/30 del Consejo Económico y Social, de 24 de junio de 1996, la JIFE estableció previsiones de las necesidades anuales del uso lícito de sustancias sicotrópicas para los países que aún no habían presentado tal información. En el siguiente cuadro, las previsiones establecidas por la JIFE se indican con una nota de pie página ^(a).

Las previsiones establecidas por la JIFE reflejan los patrones previos de consumo de sustancias sicotrópicas en los países respectivos. Estas previsiones no deben ser consideradas como niveles de consumo recomendados. Su único objetivo es proporcionar a los países exportadores información aproximada sobre las necesidades legítimas del país importador. La Junta exhorta a todos los gobiernos interesados a establecer sus propias previsiones tan pronto como sea posible.

Los países exportadores deberán tener en cuenta que los países importadores pueden reemplazar cualquier sustancia para la cual la JIFE ha establecido una previsión por otra sustancia perteneciente al mismo grupo terapéutico y a la misma lista, siempre y cuando la cantidad que se vaya a importar, expresada en dosis diarias definidas con fines terapéuticos (S-DDD), no exceda de la cantidad equivalente de la previsión, expresada también en S-DDD. En el Cuadro III.2 de la presente publicación se indican la composición de los respectivos grupos terapéuticos y las S-DDD de las sustancias de esos grupos.

Table VI. Prohibition of and restrictions on export and import pursuant to article 13 of the Convention on Psychotropic Substances of 1971

The Secretary-General has transmitted to all Governments notifications concerning the prohibition of the importation of specific substances in Schedules II, III or IV of the Convention on Psychotropic Substances of 1971 that were received from the countries indicated in the table below. The notifications are presented as follows: notifying countries listed alphabetically, followed by the prohibited substances and dates of notification. The prohibitions are effective, with respect to exporting

countries, as of the date of receipt of the Secretary-General's notification.

Upon notification of a prohibition, an exporting country must take measures to ensure that none of the substances specified in the notification are exported to the country or any of the regions in the notifying country. Exports of a prohibited substance may be permitted only when a special import licence has been issued by the notifying country, in accordance with the provisions of article 13 of the 1971 Convention.

Tables of reported statistics

The tables in the present section contain the statistical information on psychotropic substances in Schedules I-IV of the 1971 Convention furnished to INCB by Governments in accordance with article 16 of the Convention. As few Governments have reported the movement of substances listed in Schedule I, a brief statistical table, including statistics on total manufacture of those substances for the three-year period 2010-2012 and on stocks of and international trade in those substances for 2012, is provided. With regard to the statistical tables for substances in Schedules III and IV, it should be noted that, although the majority of countries and territories reported on substances in all schedules, some Governments have not yet extended the control measures of the 1971 Convention to all of the substances listed in Schedules III and IV. Therefore, for certain substances, the statistical data available to INCB may present only a partial picture of the global manufacture of and trade in those substances.

With respect to substances in Schedules I and II, Governments are requested by INCB to report quantities in grams. While the gram (g) is the unit of weight used in the statistics on substances in Schedule I, the kilogram (kg) is the unit of weight used for the statistics on substances in Schedules II, III and IV. If a country has reported the movement of less than 500 grams of a substance in Schedule II, that information has not been included in the statistical tables. However, such small quantities, as well as fractions of kilograms, have been considered when calculating the total manufacture, import and export of each substance. Therefore, for substances in Schedule II, the total generally exceeds the sum of the individual quantities expressed in full kilograms.

For substances in Schedule II, the presentation of the statistical data is made substance by substance. For each substance, the first part refers exclusively to data obtained from manufacturing countries. The second and third parts refer to international trade. For substances in Schedule III, the manufacture of all substances is presented in the first part, while the second and third parts show international trade in all substances. For Schedules II and III, data for the

years 2008-2012 are presented. Tables for substances in Schedule IV contain data for the years 2010-2012 only. For technical reasons, substances in Schedule IV were divided into the following five groups for the presentation of data on manufacture and international trade:

- Group I: Central nervous system stimulants;
- Group II: Anxiolytics, first part:
main benzodiazepines and meprobamate;
- Group III: Anxiolytics, second part:
less common benzodiazepines;
- Group IV: Benzodiazepines:
sedative-hypnotics and anti-epileptics;
- Group V: Sedative-hypnotics and barbiturate-type
anti-epileptics.

Amineptine, aminorex, 4-bromo-2,5-dimethoxyphenethylamine (2C-B), camazepam, ethchlorvynol, ethinamate, etilamfetamine, fencamfamin, lefetamine (SPA), mefenorex, mesocarb, methyprylon, phenmetrazine and pyrovalerone were not included in any table since reports on these substances have been very limited.

The following symbols are used in the tables:

A dash (—) indicates nil or less than 500 grams in the case of substances in Schedule II, III or IV (less than 1 milligram in the case of substances in Schedule I);

A question mark (?) indicates that a statistical report was not furnished;

Two dots (. .) indicate that a statistical report was furnished but data are not available for the substance in question.

^aThe Netherlands Antilles was dissolved on 10 October 2010, resulting in two constituent entities, Curaçao and Sint Maarten. — Le 10 octobre 2010, les Antilles néerlandaises ont cessé d'exister et Curaçao et Saint-Martin sont devenus deux pays constitutifs autonomes. — Las Antillas Neerlandesas quedaron disueltas el 10 de octubre de 2010 y Curaçao y Sint Maarten pasaron a ser dos nuevas entidades autónomas.

About the International Narcotics Control Board

The International Narcotics Control Board (INCB) is an independent and quasi-judicial control organ, established by treaty, for monitoring the implementation of the international drug control treaties. It had predecessors under the former drug control treaties as far back as the time of the League of Nations.

Composition

INCB consists of 13 members who are elected by the Economic and Social Council and who serve in their personal capacity, not as Government representatives. Three members with medical, pharmacological or pharmaceutical experience are elected from a list of persons nominated by the World Health Organization (WHO) and 10 members are elected from a list of persons nominated by Governments. Members of the Board are persons who, by their competence, impartiality and disinterestedness, command general confidence. The Council, in consultation with INCB, makes all arrangements necessary to ensure the full technical independence of the Board in carrying out its functions. INCB has a secretariat that assists it in the exercise of its treaty-related functions. The INCB secretariat is an administrative entity of the United Nations Office on Drugs and Crime, but it reports solely to the Board on matters of substance. INCB closely collaborates with the Office in the framework of arrangements approved by the Council in its resolution 1991/48. INCB also cooperates with other international bodies concerned with drug control, including not only the Council and its Commission on Narcotic Drugs, but also the relevant specialized agencies of the United Nations, particularly WHO. It also cooperates with bodies outside the United Nations system, especially the International Criminal Police Organization (INTERPOL) and the World Customs Organization.

Functions

The functions of INCB are laid down in the following treaties: the Single Convention on Narcotic Drugs of 1961 as amended by the 1972 Protocol; the Convention on Psychotropic Substances of 1971; and the United Nations Convention against Illicit Traffic in Narcotic Drugs and Psychotropic Substances of 1988. Broadly speaking, INCB deals with the following:

(a) As regards the licit manufacture of, trade in and use of drugs, INCB endeavours, in cooperation with Governments, to ensure that adequate supplies of drugs are available for medical and scientific uses and that the diversion of drugs from licit sources to illicit channels does not occur. INCB also monitors Governments' control over chemicals used in the illicit manufacture of drugs and assists them in preventing the diversion of those chemicals into the illicit traffic;

(b) As regards the illicit manufacture of, trafficking in and use of drugs, INCB identifies weaknesses in national and international control systems and contributes to correcting such situations. INCB is also responsible for assessing chemicals used in the illicit manufacture of drugs, in order to determine whether they should be placed under international control.

In the discharge of its responsibilities, INCB:

(a) Administers a system of estimates for narcotic drugs and a voluntary assessment system for psychotropic substances and

monitors licit activities involving drugs through a statistical returns system, with a view to assisting Governments in achieving, inter alia, a balance between supply and demand;

(b) Monitors and promotes measures taken by Governments to prevent the diversion of substances frequently used in the illicit manufacture of narcotic drugs and psychotropic substances and assesses such substances to determine whether there is a need for changes in the scope of control of Tables I and II of the 1988 Convention;

(c) Analyses information provided by Governments, United Nations bodies, specialized agencies or other competent international organizations, with a view to ensuring that the provisions of the international drug control treaties are adequately carried out by Governments, and recommends remedial measures;

(d) Maintains a permanent dialogue with Governments to assist them in complying with their obligations under the international drug control treaties and, to that end, recommends, where appropriate, technical or financial assistance to be provided.

INCB is called upon to ask for explanations in the event of apparent violations of the treaties, to propose appropriate remedial measures to Governments that are not fully applying the provisions of the treaties or are encountering difficulties in applying them and, where necessary, to assist Governments in overcoming such difficulties. If, however, INCB notes that the measures necessary to remedy a serious situation have not been taken, it may call the matter to the attention of the parties concerned, the Commission on Narcotic Drugs and the Economic and Social Council. As a last resort, the treaties empower INCB to recommend to parties that they stop importing drugs from a defaulting country, exporting drugs to it or both. In all cases, INCB acts in close cooperation with Governments.

INCB assists national administrations in meeting their obligations under the conventions. To that end, it proposes and participates in regional training seminars and programmes for drug control administrators.

Reports

The international drug control treaties require INCB to prepare an annual report on its work. The annual report contains an analysis of the drug control situation worldwide so that Governments are kept aware of existing and potential situations that may endanger the objectives of the international drug control treaties. INCB draws the attention of Governments to gaps and weaknesses in national control and in treaty compliance; it also makes suggestions and recommendations for improvements at both the national and international levels. The annual report is based on information provided by Governments to INCB, United Nations entities and other organizations. It also uses information provided through other international organizations, such as INTERPOL and the World Customs Organization, as well as regional organizations.

The annual report of INCB is supplemented by detailed technical reports. They contain data on the licit movement of narcotic drugs and psychotropic substances required for medical and scientific

purposes, together with an analysis of those data by INCB. Those data are required for the proper functioning of the system of control over the licit movement of narcotic drugs and psychotropic substances, including preventing their diversion to illicit channels. Moreover, under the provisions of article 12 of the 1988 Convention, INCB reports

annually to the Commission on Narcotic Drugs on the implementation of that article. That report, which gives an account of the results of the monitoring of precursors and of the chemicals frequently used in the illicit manufacture of narcotic drugs and psychotropic substances, is also published as a supplement to the annual report.

INTERNATIONAL NARCOTICS CONTROL BOARD

The International Narcotics Control Board (INCB) is the independent monitoring body for the implementation of United Nations international drug control conventions. It was established in 1968 in accordance with the Single Convention on Narcotic Drugs, 1961. It had predecessors under the former drug control treaties as far back as the time of the League of Nations.

Based on its activities, INCB publishes an annual report that is submitted to the United Nations Economic and Social Council through the Commission on Narcotic Drugs. The report provides a comprehensive survey of the drug control situation in various parts of the world. As an impartial body, INCB tries to identify and predict dangerous trends and suggests necessary measures to be taken.
